RE: Phase Two Environmental Site Assessment
National Geospatial Intelligence Agency (Proposed)
St. Louis, Missouri
SCI No. 2015-0461.21

Dear Mr. March:

SCI Engineering, Inc. (SCI) has completed the Phase Two Environmental Site Assessment (Phase Two) at the above-referenced site, the report of which is contained herein. The subject site was historically developed with various commercial/light industrial operations, as well as numerous residences. Phase Two activities were performed to investigate potential for impacted soils and/or groundwater to be present on the site in association with these former uses.

Phase Two activities were performed in general accordance with our proposal dated December 9, 2015. Revisions to the scope of work were made on December 21, 2015 and January 29, 2016. These investigations included the advancement of soil borings with soil and groundwater sampling as well as trenching activities, which included the collection of bulk asbestos samples. Phase Two services are detailed in the enclosed report.

SCI appreciates being of service to you on this project. Please contact us if you have any questions or comments regarding this report.

Respectfully,

**SCI ENGINEERING, INC.**

**Phase Two Environmental Site Assessment**

**NATIONAL GEOSPATIAL INTELLIGENCE AGENCY (PROPOSED)**
**ST. LOUIS, MISSOURI**

## 1.0 INTRODUCTION

A Phase One Environmental Site Assessment (Phase One) was conducted on the subject site by Environmental Operations, Inc. (EOI). This Phase One recommended the completion of a Phase Two Environmental Site Assessment (Phase Two). Following this recommendation, the Missouri Department of Natural Resources (MDNR) issued a Request For Proposals (RFP) dated November 18, 2015. During the project bidding, SCI was provided with a scope of work, prepared by EOI for the project. However, the scope presented in the RFP issued by MDNR, and the scope prepared by EOI for the project were not congruent. Through conversations with MDNR, SCI was able to complete a proposed scope of work for the project, dated December 9, 2015, which was accepted by MDNR on December 10, 2015. As such, the activities detailed in this report are in accordance with the SCI proposal dated December 9, 2015. A copy of this document is included in Appendix A.

In an effort to evaluate the potential for impacted soils and/or groundwater to be present on the site in association with the former uses, the following activities were conducted on the site:

- Soil borings with soil and groundwater sampling;
- Trenching with the collection of samples from buried rubble fills of suspected asbestos-containing materials (ACMs); and
- A Ground Penetrating Radar (GPR) survey was conducted.

A summary of these activities is discussed below.

## 2.0 PHASE TWO INVESTIGATIONS

### 2.1 Soil Boring Activities

#### *2.1.1 Soil Sampling*

A total of seventy-seven borings were outlined in the scope prepared by EOI for the project. The MDNR RFP requested that seventy-two borings be advanced on the subject site. SCI proceeded with the advancement of the seventy-two borings, as outlined in our proposal dated December 9, 2015. Various borings were removed from the EOI scope to come to the project total of 72. Additionally, during the course of the completion of the project, access was restricted to five of the boring locations. Boring locations are depicted on Figure 1 – Soil Boring and Trench Location Map.

DRAFT

Each of the soil borings extended to 20 feet below the ground surface (bgs), with the exceptions of SCI-10 through SCI-12, SCI-29, SCI-37, SCI-52, SCI-58, SCI-59, and SCI-65. Probe refusal was encountered at these locations at depths ranging from nine to 19 feet bgs. Soil samples were continuously collected throughout drilling activities. The soil samples were screened on approximate 2-foot vertical intervals using a photo-ionization detector (PID), which is capable of detecting variations in concentrations of various organic trace gases, such as those associated with many petroleum products and solvents. SCI also screened the soils for evidence of unusual staining or odors. Samples were collected for laboratory analysis from the upper three feet of soil and at the location of the highest PID reading at each of the boring locations, unless no PID readings were observed. If this was the case, the subsurface samples were collected from the depth at which the perched groundwater zone was observed. If no evidence of perched groundwater was noted, the deepest soil sample was collected.

Conditions encountered during drilling activities, including PID readings and soil types, are outlined on the Boring Logs enclosed as Appendix B.

### *2.1.2 Groundwater Sampling*

Following soil sampling, temporary piezometers were installed at the locations prescribed in the EOI scope of work. These were presented on a per city block basis. As such, SCI selected the boring for each piezometer based on the likelihood of encountering impact at that location as opposed to the other borings on the city block. This was determined by a review of the PID readings and visual observations during drilling. The piezometers were constructed of Schedule 40 slotted (0.010-inch) PVC (polyvinyl chloride) for the bottom 10 feet of the wells with a Schedule 40 PVC riser installed above the screen to within 10 inches of the ground surface.

Approximately 48 hours following piezometer installation, SCI returned to the site to attempt to collect groundwater samples for laboratory analysis. Prior to each sampling event, SCI utilized an interface probe to determine the depth to groundwater in each piezometer. The piezometers were then sampled using disposable plastic bailers. The use of disposable bailers for each sampling event prevents any cross-contamination from occurring between piezometers. All of the piezometers produced adequate volumes of water for sample collection and analysis.

DRAFT

The piezometers were abandoned following sample collection. The PVC screens and risers were removed and the borehole was then filled with betonite chips.

### *2.1.3 Soil Borings - Analytical Testing*

The soil samples collected from the borings were analyzed for the RCRA heavy metals by U.S. EPA Method 6010, volatile organic compounds (VOCs) and total petroleum hydrocarbons – gasoline range organics (TPH-GRO) by U.S. EPA Method 8260, and total petroleum hydrocarbons diesel range organics/oil range organics (TPH-DRO/ORO) plus polynuclear aromatic hydrocarbons (PAHs) by U.S. EPA Method 8270.

The groundwater samples were analyzed for the same constituents as above, with the exception of RCRA metals.

The soil and groundwater samples were transferred to pre-cleaned, laboratory-provided containers, placed on ice and transported to the laboratory for analysis using standard chain-of-custody procedures.

Complete laboratory results from the soil samples as well as the associated chain-of-custody documentation are enclosed as Appendix C. The results of the analytes detected by laboratory analysis of soil samples are summarized in Table 1, enclosed in Appendix C. This table also includes a comparison of the detected laboratory results to the MDNR Default Target Levels (DTLs) or naturally occurring background concentrations in St. Louis City for metals, as applicable. SCI only compared to the background concentrations if these exceeded the DTLs.

Complete laboratory results from the groundwater samples as well as the associated chain-of-custody documentation are enclosed as Appendix D. Results of analytes detected by laboratory analysis of groundwater samples are summarized in Table 2, also enclosed in Appendix D. This table also includes a comparison of the detected laboratory results to the MDNR DTLs.

MDNR DTLs are the most conservative target levels established by the MDNR and are based on unrestricted land use. The MDNR Tier One RBTLs are based on the potential routes of exposure (inhalation, ingestion, and dermal contact) associated with the current and future land use of the property (residential or non-residential) as well construction worker exposure. For the purposes of this Phase Two, concentrations of target analytes in the soil samples which exceeded the DTLs or background concentrations were further compared to the Tier One, Soil Type 1 Residential RBTLs and Non-

DRAFT

Residential RBTLs, as well as the Construction Worker RBTLs. Samples collected from surficial soils were compared to the cumulative exposure route RBTLs. Subsurface samples were compared to the indoor inhalation exposure route. The cumulative exposure construction worker RBTLs were also utilized.

Concentrations of target analytes in the groundwater samples which exceeded the DTLs were compared to the indoor inhalation of vapors exposure pathway RBTLs for residential and non-residential exposures. Construction worker RBTLs for dermal contact were used for the groundwater result comparison.

#### *2.1.4 Soil Analytical Test Results*

Several concentrations of target analytes exceeded the DTLs or background concentrations, as well as the Residential and Non-Residential RBTLs. Compounds noted in excess of these thresholds included metals, PAHs, and other semi-volatile organic compounds (SVOCs). Concentrations of lead on the subject site were noted in excess of the Construction Worker RBTLs. The majority of the RBTL exceedences were encountered in the surficial soils.

A summary of these analytical results and comparison to the regulatory target levels can be found in Appendix C, Table 1. A summary of these results on a city block basis can be found in Appendix E, Table 3.

#### *2.1.5 Analytical Test Results - Groundwater*

In the groundwater samples collected from the site, several concentrations of target analytes exceeded the DTLs. None of these concentrations exceeded the Tier One Residential or Non-Residential RBTLs.

A summary of these analytical results and comparison to the regulatory target levels can be found in Appendix D, Table 2. A summary of these results on a city block basis can be found in Appendix F, Table 4.

### 2.2 Trenching Activities

SCI advanced a total of 63 trenches on the subject site. these trenches were advanced at the locations provided on the EOI scope of work. Trenches were advanced to a depth of 5 feet bgs or into native soils, whichever was shallower. The locations of the trenches are depicted on Figure 1 – Boring and Trench Locations Map. Trenches are identified as T-1 through T-76.

DRAFT

Buried urban fill materials including bricks, rubble, concrete, and other building debris were observed throughout the subject site. Four underground storage tanks (USTs) were identified in T-32, along with 25-30 automotive tires. Potential heating oil USTs were identified in T-24 and T-26. Soils with visual and olfactory indicators of petroleum impacts were identified at T-38. Native soils consisted of brown, lean clays.

### *2.2.1 Sampling Activities*

As mentioned above, SCI collected bulk samples of suspected asbestos containing materials during the trenching activities. These samples were analyzed for asbestos by Polarized Light Microscopy (PLM). A summary of the results is included in Appendix G, Table 5. Complete analytical results and associated chain of custody documentation is included in Appendix G.

Asbestos containing materials were encountered at several locations on the subject site. ACMs identified included the following:

- Tile with paper backing (T-7, 395 feet, C.B. 1079);
- Roofing material (T-14, 78 feet, C.B. 1083);
- Yellow spotted tile (T-31, 132 feet, C.B. 1082);
- Green tile (T-6, 36 feet, C.B. 1093);
- Transite (T-2, 84 feet, C.B. 1092);
- Green tile (T-1, 30 feet, C.B. 1085);
- Pink checkered tile (T-35, 40 feet, C.B. 2346);
- White tile (T-45, 22 feet, C.B. 2327);
- Fireproofing (T-50, 82 feet, C.B. 2328);
- Yellow tile (T-71, 140 feet, C.B. 2318); and
- Tan tile (T-71, 140 feet, C.B. 2318).

The locations of these materials, as well as the other ACM samples collected during the course of the trenching activities are included on Figure 2, ACM Sample Locations Map.

DRAFT

### 2.3 Ground Penetrating Radar (GPR) Survey

As part of the proposed scope, SCI oversaw the performance of a GPR survey on selected lots on the subject site. The intent of this survey was to attempt to identify evidence of anomalies in the ground, which could be indicative of USTs or other buried structures.

During this period, GPR activities were completed on January 7, 2016. The survey identified anomalies in the subsurface up to 8 feet below ground surface (bgs). The results of these activities are summarized below.

| Site Area (nearest intersection) | Results |
|---|---|
| 23rd Street and North Market Street (northeast corner) | No objects identified |
| 22nd Street and North Market Street (northwest corner) | Five objects were identified on this corner. During trenching activities, SCI uncovered four USTs that appeared to be closed in place. |
| 23rd Street and Maiden Street (northwest corner) | One object was identified running east to west across parcel, likely either a UST, concrete slab/foundation, or other buried structure. |

## 3.0 QUALITY ASSURANCE/QUALITY CONTROL

SCI's fieldwork was performed in accordance with SCI's Standard Operating Procedures, and the Quality Assurance Project Plan (QAPP). Fieldwork included the collection of a duplicate soil, groundwater, and bulk samples. These samples are identified with a "D" in the sample ID, located in Tables 1, 2, and 5.

SCI noted that a few of the laboratory reporting limits were above MRBCA reporting limits. It is noted that the Teklab analytical reports indicated that these elevated reported limits were caused by elevated levels of target analytes within the samples. It is likely that this is caused by the need for sample dilution due to these elevated levels. Some other instances of elevated reporting limits were caused by sample or matrix composition. SCI does not consider this to be of concern in terms of data quality.

SCI also reviewed the results for the equipment and trip blank samples. No detected analytes were identified in the trip or equipment blank samples. Therefore, SCI considers the field sampling and shipping activities to be acceptable.

SCI also compared results of the replicate and duplicate samples and calculated a Relative Percent Difference (RPD) for each analyte detected. The RPDs of the duplicate and replicate samples were compared to the RPDs of the Matrix Spike and Matrix Spike Duplicates analyzed by Teklab, Inc.

DRAFT

The duplicate and replicate RPDs were similar to these calculated by the lab, with some exceptions. These exceptions are likely due to the soil consisting of urban fill and therefore not being homogenous.

Based on the information outline above, it is SCI's opinion that the laboratory data accurately reflects conditions at the locations sampled.

## 4.0 CONCLUSIONS/RECOMMENDATIONS

As detailed above, SCI has performed soil boring and trenching investigations as part of Phase Two activities.

SCI's soil and groundwater sampling activities revealed evidence of impacts in excess of the MDNR DTLs and Tier One Residential, Non-Residential, and Construction Worker RBTLs on the subject site. These impacts were predominantly associated with arsenic, lead, and PAHs, and were noted most often in the surficial soils on the subject site.

During the trenching activities, SCI encountered buried rubble including bricks, concrete, trash, and other debris. When encountered, SCI collected samples of suspect ACMs from the trenches. Analytical testing of these samples identified several ACMs on the subject site.

SCI's GPR survey revealed evidence of anomalies on two of the three lots surveyed. These anomalies may be USTs or other buried structures. Intrusive investigations would be required to further investigate these items.

SCI recommends that this impact be addressed using a risk-based approach that compliments the future land use and is protective of future receptors.

Based on the results of the various soil samples collected during the soil boring activities, it appears that the majority of the surficial soils/fill and subsurface soils on the subject site would be considered special waste, if disposed of in a Missouri-licensed landfill. Due to the fact that several of the samples exceeded one or more of the MDNR DTLs, the soil on the subject site would not be considered clean fill and should not be used as fill on another property without obtaining a special/beneficial use permit from the MDNR.

DRAFT

## 5.0 LIMITATIONS

This report has been prepared for the exclusive use of the Missouri Department of Natural Resources. SCI is not responsible for independent conclusions or recommendations made by others. Furthermore, written consent must be provided by SCI should anyone other than our client wish to excerpt, or rely on, the contents of this report. The findings of this report are valid as of the present date of the assessment.

It is noted that SCI's Limited Phase Two activities were performed in an attempt to identify widespread soil and groundwater impact associated with the RECs outlined in the Phase One. SCI's Phase Two activities were performed in areas most likely to be impacted by the identified concerns; however, there is a potential for localized impact to be present in other areas not investigated during Phase Two activities. If encountered during future development activities, SCI recommends any such impact be properly addressed.

Changes in surface and subsurface conditions of a property can occur with the passage of time, whether due to natural processes or the works of man on this or adjacent properties. In addition, changes in applicable or appropriate standards may occur, whether they result from legislation, the broadening of knowledge, or other reasons. Accordingly, the findings of this report may be invalidated in whole or in part by changes outside our control.

SCI should be contacted with any known or suspected variations from the conditions described herein. If further development of this site indicates the presence of hazardous, toxic, or petroleum materials, or other concerns of an environmental nature, SCI should be notified to perform a re-evaluation of the environmental conditions.

RE: Proposal for Limited Phase Two Environmental Site Assessment (Updated w/ QA/QC Samples)
National Geospatial Intelligence Agency (Proposed)
St. Louis, Missouri
SCI No. 2015-0461.21

Dear Mr. March:

**INTRODUCTION**

SCI Engineering, Inc. (SCI) is pleased to submit this proposal for a Phase Two Environmental Site Assessment (Phase Two) at the above-referenced site. The site is an assortment of 391 properties all located within the footprint of the proposal location for the National Geospatial Intelligence Agency facility.

SCI understands that Environmental Operations, Inc. (EOI) completed a Phase One Environmental Site Assessment (Phase One) of the entire property dated October, 2015. The October, 2015 Phase One identified several environmental concerns which will be investigated per the Missouri Department of Natural Resources (MDNR) Request for Proposal (RFP), dated November 18, 2015.

The Phase Two scope of work, as further detailed below, includes various soil and groundwater sampling activities following or in conjunction with the advancement of soil boring and trenches. A survey using ground penetrating radar (GPR) will also be performed on several properties within the site boundary. Lastly, a visual survey of suspect asbestos containing materials (ACM) will be performed for each of the on-site structures.

**GEOPROBE INVESTIGATION**

At your request, SCI will advance 72 borings at various locations throughout the subject site. A Geoprobe system will be used to hydraulically drive 2½-inch diameter stainless steel probes to a depth of 20 feet below ground surface (bgs) at selected locations.

Soil samples will be continuously collected throughout the depth of each probe advancement. Soil samples will be retrieved using a closed-point type, large bore sampler assembly which requires a 2½-inch-diameter by 4-foot-long soil core in an acetate sleeve sample liner.

Each soil sample retrieved will be screened on approximate 2-foot vertical intervals using a photo-ionization detector (PID). This PID is capable of detecting variations in concentrations of organic trace gases, including aromatic petroleum hydrocarbons. This sampling protocol and subsequent screening process will aid in determining the vertical extent of soil impact, if present.

Surficial soils (0-3' bgs) will be collected for analytical testing form each boring location. The subsurface soil sample with the highest PID reading from each boring will be submitted for analytical testing. If no PID reading is encountered, the sample from immediately above the assumed perched groundwater saturation zone, or the deepest sample if no groundwater is observed, will be submitted for analysis.

Each soil sample will be placed into laboratory provided containers and transported under proper chain-of-custody procedures to the laboratory in chilled containers.

Decontamination procedures will consist of washing all sampling equipment in a solution of tap water and laboratory grade detergent (liquinox) followed by tap water rinse and double rinse with distilled water.

As part of the proposed scope, SCI will notify Missouri One Call, to locate public utilities. You will be responsible to locate all private utilities or structures. As such, SCI will not be responsible for damage to any unmarked or unknown utilities or structures.

**Groundwater Sampling**

When the targeted soil boring depth is reached at 21 of the boring locations, a piezometer will be installed. The piezometers will be constructed of a Schedule 40 PVC (polyvinyl chloride) riser and screen. The screened interval is anticipated to be 10-slot (0.010-inch) for a 10-foot interval.

The piezometers will be emplaced such that the screen extends approximately 5 feet below the groundwater level observed at the time of drilling. SCI will attempt to collect a representative water sample at the time of piezometer installation. However, should groundwater not be present on the date of drilling, SCI will return approximately 72 hours later in attempt to collect groundwater samples. As soon as the water samples are collected, the piezometers will be removed and the remaining void space will be filled with bentonite. The surface will be repaired as appropriate. Water samples will be transported to the laboratory in chilled containers.

**Analytical Testing**

The soil and groundwater samples collected during Phase Two activities will analyzed for the following parameters:

- Volatile organic compounds (VOCs) and total petroleum hydrocarbons-gasoline range organics (TPH-GRO) by U.S. EPA method 8260 (72 surface samples, 72 subsurface samples, 29 groundwater samples);
- TPH-diesel range organics and oil range organics plus polynuclear aromatic hydrocarbons (TPH-DRO/ORO plus PAHs) by U.S. EPA Method 8270 (72 surface samples, 72 subsurface samples, 19 groundwater samples;
- RCRA 8 heavy metals by U.S. EPA method 601072 (72 surface samples, 72 subsurface samples); and

- Polychlorinated byphenyls (PCBs) analysis by U.S. EPA Method 8082 (3 surface samples, 6 subsurface samples).

In addition to the requested samples and associated analysis, SCI will submit 10% of soil and groundwater samples for QA/QC purposes. These QA/QC samples will be analyzed for VOCs and GRO, via Method 8260, TPH-DRO/ORO and PAHs via Method 8270, RCRA 8 metals via Method 6010 and PCBs via Method 8082.

**TRENCHING ACTIVITIES**

SCI will advance 72 trenches, totaling 13,300 linear feet on the subject site. SCI assumes that the depth of the trench will not extend below 5 feet bgs. SCI will screen the excavations for evidence of urban fill materials. If encountered, the locations of the fill material will be noted.

SCI will collect bulk samples of suspected ACM identified within the fill material and will analyze each sample for the presence of asbestos, using polarized light microscopy (PLM). Per the RFP, approximately 142 bulk samples (1 sample per 100 linear feet) are anticipated.

In additional the 142 requested bulk samples, SCI will collect and submit 10% (15 additional samples) for QA/QC purposes.

Excavated materials will be re-placed in the excavation and packed down using the on-site equipment. Compaction testing will not be performed as part of this scope.

**GROUND PENETRATING RADAR (GPR) SURVEY**

SCI will conduct a GPR survey of selected subject site lots which may have hosted underground storage tanks (USTs). The purpose of this survey will be to attempt to identify whether or not USTs still remain on portions of the site. A summary of the findings of this activity will be included in the associated report.

Per our discussion with MDNR, there will be three properties which require GPR surveys.

**VISUAL SURVEY FOR ASBESTOS CONTAINING MATERIAL (ACM)**

SCI will conduct a visual survey for ACMs with the accessible areas of the on-site structures. The purpose of these activities will be to identify the type, amount, and condition of suspected ACM within the structures. SCI will use the information provided by these visual surveys to develop a sampling plan that characterizes the material amount, location, and anticipated number of samples required for each structure.

**FORMAL REPORT**

Results of the Phase Two scope of work outlined in this proposal will be reviewed by the VCP project manager. SCI's findings and recommendations will be presented in a formal report, and will be organized on a “per city-block” basis The report will include a description of sampling methods, laboratory data, a site plan, and all supporting data.

The results of the visual asbestos surveys will be provided in a separate report, as will be asbestos abatement sampling plan.

## ESTIMATED SCHEDULE

SCIs work on the project will begin within 10 days of receipt of you authorization-to proceed. SCI estimates that 8 to 10 weeks will be required to complete the project. For example, if the project is awarded on December 11th, a draft report will be submitted to the BVCP for review not later than the end February 12th, 2016. However, if you have a more specific deadline, please contact us.

## COST OF SERVICES

The activities described herein will be performed on a time and material basis in accordance with the hourly rates and fixed unit prices specified on the pricing page of our contract. Below is a breakdown of estimated hours and costs for the scope of work outlined above.

| **Phase Two Environmental Site Assessment Activities – National Geospatial Intelligence Agency (Proposed)** | | |
|---|---|---|
| Project Manager | | |
| Scientist | | |

| Phase Two Environmental Site Assessment Activities – National Geospatial Intelligence Agency (Proposed)-continued | | |
|---|---|---|
| GPR Survey (3 properties) | | |
| Markup on GPR Survey | | |
| **Not to Exceed Total** | | |

Per our discussion with MDNR, with the exception of the GPR survey(s), the scope of work outlined above is based on the information (i.e. number of soil borings, number of piezometer, number of soil/groundwater samples) provided in the RFP document and not the workplan prepared by EOI.

This proposal assumes that the MDNR will provide SCI access to each of the subject site lots and structures, as necessary. Additional borings will be conducted at the unit rate described above. Our fees assume that the borings/trenches will be conducted during a single mobilization. Should additional mobilizations be required after excavation/drilling equipment has demobilized from the site, additional fees will apply.

SCI proposes to subcontract Schneider Laboratory Global, Inc., Global Environmental, Inc., and PSA Environmental, all of which are Missouri-certified WBE and/or MBE businesses.

Thank you for the opportunity to be of continued service to you on this project. If you have any questions regarding this proposal, or desire to modify the proposed scope, please do not hesitate to call.

Respectfully,

**SCI ENGINEERING, INC.**

**FAILURE OF THIS CONTRACTOR TO PAY THOSE PERSONS SUPPLYING MATERIAL OR SERVICES TO COMPLETE THIS CONTRACT CAN RESULT IN THE FILING OF A MECHANIC'S LIEN ON THE PROPERTY WHICH IS THE SUBJECT OF THIS CONTRACT PURSUANT TO CHAPTER 429.RSMo. TO AVOID THIS RESULT YOU MAY ASK THIS CONTRACTOR FOR "LIEN WAIVERS" FROM ALL PERSONS SUPPLYING MATERIAL OR SERVICES FOR THE WORK DESCRIBED IN THIS CONTRACT. FAILURE TO SECURE LIEN WAIVERS MAY RESULT IN YOU PAYING FOR LABOR AND MATERIAL TWICE.**

SCI ENGINEERING, INC.
130 Point West Boulevard
St. Charles, Missouri 63301
636-949-8200 Fax 636-949-8269
www.sciengineering.com

# GENERAL TERMS AND CONDITIONS

1. **ACCEPTANCE OF AGREEMENT** The terms and conditions of the agreement between the client and SCI ENGINEERING, INC. (hereinafter called SCI) are detailed below and have been established to allocate risks between both. For the purposes of convenience, the client may choose to orally authorize our service, in which case the client agrees that the verbal agreement constitutes formal acceptance of the terms and conditions detailed below. Subsequent to an agreement by both parties to perform the services, modifications to the terms and conditions are prohibited.

2. **SITE ENTRY** You, the Client, will provide for right of entry of SCI or employees of firms working under the direction of SCI, and all necessary equipment, in order to perform the work. Although SCI will exercise reasonable care in performing its services, the Client understands that use of testing or other equipment may unavoidably cause some damage, the correction of which is not part of this agreement. The client agrees, to the fullest extent permitted by law, to indemnify and hold harmless SCI and its subconsultants against any damages, liabilities, or costs, arising or allegedly arising from procedures associated with testing or investigative activities. If you desire or require us to restore the site to its former condition, upon written request, we will perform such additional work as is necessary and you agree to pay all costs incurred.

3. **SUBSURFACE STRUCTURES OR UTILITIES** The Client will furnish to SCI information identifying the type and location of utility lines and other man-made objects beneath the site's surface. SCI will take reasonable precautions to avoid damaging these man-made objects . You agree to waive any claim against SCI, and to defend, indemnify and hold SCI harmless from any claim or liability for injury or loss allegedly arising from SCI's damaging underground utilities or other man-made objects that were not called to SCI's attention, or which were not properly located on plans furnished to SCI.

4. **SAMPLES** Soil, rock, water, or other samples obtained from the project site are your property. SCI shall preserve such samples for no longer than thirty (30) calendar days after the issuance of any document that includes the data obtained from them, unless other mutually agreed arrangements are documented.

Concrete test specimens will be discarded after testing. If project specification strengths are met, "hold" cylinders will be discarded at that time.

If in SCI's opinion any of the samples collected may be affected by regulated contaminants, SCI shall package such samples in accordance with applicable law and client shall arrange for lawful disposal procedures. SCI shall not, under this agreement, arrange for or be responsible for the disposal of substances affected by regulated contaminants. Furthermore, unless detailed in a specific work scope, SCI is not responsible for any soil cuttings or produced groundwater generated for the purpose of sample collection that may be affected by regulated contaminants that are left at a job site and were generated for the collection of soil and groundwater samples. SCI will, at the client's request, help the client identify appropriate alternatives for the off-site treatment, storage, or disposal of these materials, for additional fees.

5. **GENERAL LIABILITY AND LIMITATION** SCI agrees to hold you harmless and to indemnify you on account of any liability due to bodily injury or property damage arising directly out of our negligent operational acts, but such hold harmless and indemnity will be limited to that covered by our comprehensive general liability insurance. Our general liability insurance, subject to its limits, terms and conditions, provides protection against liability arising out of bodily injury and property damage that is the direct result of our operational negligence. At your request, SCI will provide certificates evidencing such coverage and will purchase additional limits of liability that you may require as a separate cost item to be borne by you.

You shall not be liable to SCI and SCI shall not be liable to you for any consequential damages incurred by either due to the fault of the other, regardless of the nature of this fault, or whether it was committed by you or SCI, their employees, agents, or subcontractors. Consequential damages include, but are not limited to, loss of use, loss of profit, loss of business, loss of income, loss of reputation or any other consequential damage that any party may have incurred from any cause of action, including, but not limited to negligence, strict liability, breach of contract, or breach of warranty.

6. **SHARED RISK ALLOCATION** The Client and SCI agree to allocate certain of the risks so that, to the fullest extent permitted by law, SCI's total aggregate liability to the Client is limited to $50,000.00 for any and all injuries, damages, claims, losses, expenses, or claim expenses (including attorney's and expert witness' fees) arising out of this AGREEMENT from any cause or causes. Such causes include, but are not limited to, SCI's negligence, errors, omissions, strict liability, statutory liability, breach of contract, breach of warranty, negligent misrepresentation, or other acts giving rise to liability based upon contract, tort, or statute.

Limitations on liability, waivers and indemnities in this Agreement are business understandings between the parties and shall apply to all legal theories of recovery, including breach of contract or warranty, breach of fiduciary duty, tort (including negligence), strict or statutory liability, or any other cause of action. You agree that you will not seek damages in excess of the contractually agreed-upon limitation directly or indirectly through suits against other parties who may join the Consultant as third-party defendant. None of the insurance or indemnity obligations under this agreement shall be deemed to be in conflict with this limitation of liability provision.

7. **INVOICES** You will make all payments in accordance with SCI's invoices, and payment is due upon receipt of invoice. A fee of 1½ percent per month will be payable on any amounts not paid within thirty (30) days, payment thereafter to be applied first to accrued interest and then to your unpaid amount. You agree to pay invoices under these terms and to bear collection fees, court costs, or any other reasonable expense involved in the collection of amounts not paid.

8. **HAZARDOUS MATERIALS; NOTIFICATION OF AND DISCOVERY OF** When hazardous materials are known, assumed, or suspected to exist at a site, SCI is required to take appropriate precautions to protect the health and safety of its personnel, to comply with applicable laws and regulations, and to follow procedures that SCI deems prudent to help minimize physical risks to employees and the public. You warrant that you have provided to SCI all available information about type and location of known and suspected hazardous materials on, under, or adjacent to the project site.

The discovery of unanticipated hazardous or suspected hazardous materials will constitute a changed condition mandating termination of services if SCI and you are unable to renegotiate the scope of service in a timely manner. SCI will notify you as soon as practically possible should SCI encounter unanticipated hazardous or suspected hazardous materials.

The discovery of unanticipated hazardous or suspected hazardous materials may make it necessary for SCI to take measures that in SCI's professional opinion are needed to help preserve and protect the health and safety of SCI's personnel and of the public, and/or to preserve and protect the environment. As a condition precedent to the provision of service for this project, you agree to compensate SCI for the additional fees and costs associated with any such measures and further agree to defend, indemnify, and hold harmless from any claim or liability for injury or loss arising from SCI's encountering unanticipated hazardous or suspected hazardous materials.

9. **CONTAMINATION OF AN AQUIFER** Unavoidable contamination of soil or groundwater may occur during subsurface exploration, as when drilling or sampling tools penetrate a contaminated area, linking it to an aquifer, underground stream, or other hydrous body not previously contaminated and capable of spreading contaminants. Because subsurface exploration is an essential aspect of the services that SCI will provide on your behalf, you shall indemnify, defend, and hold SCI harmless from any claim or liability for injury or loss which may arise as a result of contamination allegedly caused by subsurface exploration.

10. **SITE SAFETY** With respect to project site safety, SCI shall be responsible solely for the on-site activities of its employees and subcontractors, and this responsibility shall not be construed by any party to relieve you or the general contractor from your obligation to maintain a safe project site. Neither the professional activities of SCI, nor the presence of SCI's employees or subcontractors shall be construed by any party to imply that SCI has any responsibility for any contractor's methods of work performance, procedures, superintendence, sequencing of operations, or safety in, on, or about the project site. You agree that the general contractor is responsible for project site safety, and warrant that this intent shall be made evident in your agreement with the general contractor.

11. **CONSTRUCTION COST ESTIMATES** An opinion of construction cost prepared by SCI represents our judgment as a design professional and is supplied for your general guidance only. Since we have no control over the cost of labor and material, nor over competitive bidding or market conditions, we do not guarantee the accuracy of our opinion as compared to other sources, such as, contractor bids of actual cost to the owner.

12. **DEFECTS IN SERVICE** You and your personnel, contractors, and subcontractors shall promptly report to SCI any defects or suspected defects in SCI's work, in order that SCI may take prompt effective measures which in SCI's opinion will minimize the consequences of any such defect.

13. **TERMINATION** Any or all services being provided for you by SCI under these General Terms and Conditions or under separate contract may be terminated by either party upon seven (7) days prior written notice. In the event of termination, SCI shall be compensated by you for all services performed up to and including the termination date, including reimbursable expenses.

14. **ENVIRONMENTAL SITE ASSESSMENT** An Environmental Site Assessment is conducted to render an opinion about the possibility of regulated contaminants being present on, in, or beneath the site specifically at the time services were conducted. Client understands that no matter how thorough an Environmental Site Assessment is, SCI cannot know or state factually that a site is unaffected by reportable quantities of regulated contaminants. Furthermore, even if SCI believes that reportable quantities are not present, the client bears the risk that such contaminants may be present or may migrate to the site after the study is complete. Likewise, the client agrees to hold SCI harmless from any claim or liability for injury or loss arising from the unanticipated discovery of hazardous materials or suspected hazardous materials to the fullest extent permitted by law.

15. **FAILURE TO FOLLOW RECOMMENDATIONS** SCI disclaims any and all responsibility and liability for problems that may occur during implementation of SCI's plans, specifications, or recommendations when SCI is not retained to observe such implementation.

16. **ALTERATION OF INSTRUMENTS OF SERVICE** Client agrees that designs, plans, specifications, reports, proposals, and similar documents prepared by SCI are instruments of professional service, and as such, they may not under any circumstances be altered by any party except SCI. Client warrants that SCI's instruments of service will be used only and exactly as submitted by SCI. Accordingly, Client shall waive any claim against SCI and shall, to the fullest extent permitted by law, indemnify, defend, and hold SCI harmless of any claim or liability for injury or loss arising from unauthorized alteration of SCI's instruments of service.

17. **MOLD DISCLAIMER** The services performed by SCI, unless specifically addressed in our scope of services, are not intended to take into account indoor amplification of mold. SCI's services may comment on depth to groundwater and site drainage, but in no instance is this to be interpreted that we were specifically intending to reduce moisture contents and/or humidity measurements within the structure as they may relate to mold. Client understands our services, unless specifically expressed in our work scope, are in no way intended to address the potential for mold infestation, and, as such, agrees to indemnify and hold SCI harmless from any claim alleging that SCI's services caused or aggravated a mold infestation.

18. **OTHER PROVISIONS** You agree that this contract is entered into by the parties for the sole benefit of the parties to the contract, and that nothing in the contract shall be construed to create a right or benefit for any third party.

a. Neither party shall hold the other responsible for damages or delay in performance caused by acts of God, strikes, lockouts, accidents, or other events beyond the control of the other or the other's employees and agents.

b. You agree that any and all limitations of SCI's liability and indemnifications by you shall include and extend to those individuals and entities SCI retains for performance of the services under this Agreement, including but not limited to SCI's officers, directors, and employees and their heirs and assigns, and SCI's subconsultants.

c. In an effort to resolve any conflicts that arise during or following completion of the project, you and SCI agree that all disputes between us arising out of or related to this Agreement shall be submitted to non-binding mediation, unless the parties mutually agree otherwise.

d. In the event there is a dispute between SCI and you, other than collection of fees and which is not resolved by mediation, the prevailing party shall be awarded its reasonable attorney's fees, expert witness fees, and other costs. THE PARTIES TO THIS CONTRACT HEREBY AGREE TO SUBMIT ANY SUCH DISPUTE TO THE CIRCUIT COURT OF ST. CHARLES COUNTY, STATE OF MISSOURI.

e. Test borings and test pits are an accepted and informative means of subsurface exploration. However, in the nature of things, they cannot indicate with absolute certainty the nature of the subsurface conditions between and sample locations of the exploration and below the termination of the borings or pits. Therefore, a report based on test borings, test pits, or other exploration method cannot ascertain the nature of the subsurface conditions between and beyond the specific sample locations. If conditions different than are indicated in our report come to your attention after you receive the report, it is recommended that you contact SCI immediately to inform SCI completely of what you have discovered and to authorize further evaluation, if appropriate.

f. Any recommendations provided in any correspondence, reports, plans, etc. from SCI are for the exclusive use of our client and are specific to the project covered by this contract. Recommendations provided by SCI are not meant to supercede more stringent requirements of local ordinances.

Notes: All results are reported in mg/kg or parts per million.
Bold numbers exceed DTLs.
Shaded cells with bold numbers exceed Residential RBTLs.
Outlined cells exceed Non-Residential RBTLs.
[1]Risk-Based Target Levels for Residential Land Use, Soil Type 1 (sandy).
[2]Risk-Based Target Levels for Non-Residential Land Use, Soil Type 1 (sandy).
[3]Risk-Based Target Levels for Construction Worker, Soil Type 1 (sandy).
[4]Ingestion, inhalation and dermal contact.
[5]Not analyzed.
[6]Maximum background concentration in St. Louis City, as reported by the U.S. Geochemical Survey
[7]Target levels not established for some constituents.

**Table 1 – Analytical Test Results of Detected Analytes - Soil (continued)**

| Sample ID (date) / Chemical | | | SVOCs | | | | | | | | | | | | | VOCs | | |

Dear Ben Butterfield:

TEKLAB, INC received 19 samples on 12/17/2015 5:10:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Michael L. Austin
Project Manager
(618)344-1004 ex 16

## Abbr Definition

| | |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

Dear Ben Butterfield:

TEKLAB, INC received 20 samples on 12/18/2015 5:18:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

# Definitions

**Client:** SCI Engineering, Inc. **Work Order:** 15121421

**Client Project:** NGA 2015-0461.21 **Report Date:** 28-Dec-15

| Abbr | Definition |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

*Surrogate recovery is outside QC limits due to matrix interference.*

*LCS & LCSD recovered outside upper QC limits for acetone. Sample results are below reporting limit. Data is reportable per 2009 TNI Standard (Volume1, Module 4, section 1.7.4.2).*

**RE:** NGA 2015-0461.21 **WorkOrder:** 15121500

Dear Ben Butterfield:

TEKLAB, INC received 24 samples on 12/21/2015 4:35:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy
Project Manager

# Definitions

**Client:** SCI Engineering, Inc. **Work Order:** 15121500

**Client Project:** NGA 2015-0461.21 **Report Date:** 28-Dec-15

| Abbr | Definition |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

Dear Ben Butterfield:

TEKLAB, INC received 25 samples on 12/22/2015 5:00:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Michael L. Austin
Project Manager
(618)344-1004 ex 16
MAustin@teklabinc.com

**Client Project:** NGA 2015-0461.21 **Report Date:** 29-Dec-15

## Abbr Definition

| | |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |
