Meet MRBCA DTLs

Are these samples known to be involved in litigation? If yes, a surcharge will apply ☐ Yes ☒ No
Are these samples known to be hazardous? ☐ Yes ☒ No
Are there any required reporting limits to be met on the requested analysis?. If yes, please provide limits in the comment section. ☒ Yes ☐ No

**Project Name/Number**
NGA 2015-0461.21

**Sample Collector's Name**

**Results Requested**
☒ Standard ☐ 1-2 Day (100% Surcharge)
☐ Other _____ ☐ 3 Day (50% Surcharge)

**Billing Instructions**

RE: Field Activities Progress Summary
National Geospatial Intelligence Agency (Proposed)
St. Louis, Missouri
SCI No. 2015-0461.21

Dear Mr. March:

SCI Engineering, Inc. (SCI) is pleased to submit this summary report for the National Geospatial Intelligence Agency in St. Louis, Missouri from January 4 through January 8, 2016. Per the approved scope of work dated December 10, 2015, SCI has been providing soil and groundwater sampling activities, trenching, and a ground penetrating radar survey for the subject site. During the above-referenced time period, SCI was onsite for five working days. A detailed summary for each site activity during this period is described herein. The enclosed drawing includes actual and proposed boring locations for the subject site.

**SOIL AND GROUNDWATER SAMPLING**

During the above referenced period, SCI was not on site conducting soil and groundwater sampling. To date, SCI has completed 37 of the proposed 72 borings. Analytical results for these borings have been provided in previous correspondence.

SCI will remobilize to the site on January 11, 2016 to advance the remaining borings on the subject site. During this time, SCI will attempt to collect water from the remaining piezometers. SCI anticipates the completion of this phase of field work by January 15, 2016, with analytical results expected 1 to 2 weeks later.

**TRENCHING ACTIVITIES**

From January 4 through January 8, 2016, SCI completed 13 trenches for the subject site. During this time, approximately 2,500 feet of trenching were completed. To date, SCI has completed 31 of the proposed 76 trenches, for a total of 6,200 of the proposed 13,300 feet of trenching. Material observed in the trenches was visually assessed for asbestos containing materials (ACMs), and samples were collected where appropriate. To date, 100 samples have been collected for suspect ACMs. Based on current projections, SCI expects the total number of ACM samples to be around 200, which will exceed the 150 samples approved in the scope of work. SCI will hold any samples collected beyond 150 for potential future analysis beyond the current scope of work.

Based on the current rate of trenching, SCI anticipates approximately 15 working days are required to complete trenching activities on the subject site. SCI will be onsite daily as conditions permit until trenching activities are completed. SCI projects the completion of this phase of work by January 29, 2016.

**GROUND PENETRATING RADAR (GPR) SURVEY**

During this period, GPR activities were completed on January 7, 2016. The survey identified anomalies in the subsurface up to 8 feet below ground surface (bgs). The results of these activities are summarized below.

| Site Area (nearest intersection) | Results |
|---|---|
| 23rd Street and North Market Street (northeast corner) | No objects identified |
| 22nd Street and North Market Street (northwest corner) | Five objects were identified on this corner. During trenching activities, SCI uncovered four USTs that appeared to be closed in place. |
| 23rd Street and Maiden Street (northwest corner) | One object was identified running east to west across parcel, likely either UST or concrete slab/foundation. |

**SCHEDULE**

During this period, SCI experienced no lost days on site due to weather, equipment, or other delays. SCI maintains the project schedule of a draft report issuance no later than February 12, 2015. SCI will periodically update the project schedule and completion date in subsequent progress reports.

SCI appreciates being of continuing service to you on this project. Please contact us if you have any questions or concerns regarding this report.

Respectfully,

**SCI ENGINEERING, INC.**

During the above-referenced time period, SCI was onsite for five working days. A detailed summary for each site activity during this period is described herein. The enclosed drawing includes actual and proposed boring locations for the subject site.

**SOIL AND GROUNDWATER SAMPLING**

SCI remobilized to the site on January 11, 2016 to complete the reminder of the Phase Two soil borings and associated soil and groundwater sampling efforts. From January 11 through January 13, 2016, SCI advanced 31 borings on the subject site at locations SCI-40 through SCI-77. Borings SCI-56, SCI-60, and SCI-62 were omitted from the project scope after consultation with the MDNR and in order to meet the requirements of the RFP and associated scope of work. Additionally, SCI did not advance borings SCI-72 through SCI-74 and SCI-76 because access to these four proposed boring locations could not be obtained. A shallow and a deep soil sample were collected from each boring along with associated duplicates for a total of 67 soil samples. These samples were submitted to the laboratory under appropriate chain-of-custody procedures. At the time of this report, SCI has received a portion of the analytical data and will forwarding to the project team. The remainder of the laboratory reports will be provided to the project team when available.

From the 31 boring locations advanced between January 11 and 13, twelve piezometers were installed per the approved scope of work. SCI will attempt to collect water from the remaining piezometers the week of January 18th. When available, SCI will provide the analytical data from the groundwater samples

SCI anticipates the completion of this phase of field work by January 22, 2016, with analytical results expected 1 to 2 weeks later.

**TRENCHING ACTIVITIES**

From January 11 through January 15, 2016, SCI completed 16 trenches. During this time, approximately 3,700 feet of trenching was completed. To date, SCI has completed 47 of the proposed 76 trenches, for a total of 9,900 of the proposed 13,300 feet of trenching. Material observed in the trenches was visually assessed for the presence of suspect asbestos containing materials (ACMs), and samples were collected when identified. To date, 148 samples/layers have been collected for suspect ACMs. Based on amount of trenching to be completed SCI expects the total number of suspect ACM samples/layers to exceed 150, the quantity of samples included in the request for proposal and associated scope of work. SCI is in the process of preparing an addendum to the scope of work which will allow for the collection and analysis of suspect ACMs, in the likely instance that these materials are identified during the remaining trenching activities. SCI will hold the additional samples until formal authorization from the MDNR is received.

SCI projects the completion of this phase of work by January 29, 2016, weather permitting.

**GROUND PENETRATING RADAR (GPR) SURVEY**

All GPR activities required in the approved scope of work were completed on January 7, 2016 and summarized in SCI's Progress Update Report dated January 11, 2016. No further GPR activities are anticipated.

**SCHEDULE**

For the week of January 11, SCI experienced no lost days due to weather. SCI maintains the project schedule of a draft report issuance no later than February 12, 2015. SCI will periodically update the project schedule and completion date in subsequent progress reports.

SCI appreciates being of continuing service to you on this project. Please contact us if you have any questions or concerns regarding this report.

Respectfully,

**SCI ENGINEERING, INC.**

Dear Ben Butterfield:

TEKLAB, INC received 17 samples on 1/11/2016 4:30:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

## Abbr Definition

| | |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

RE: Field Activities Progress Summary
National Geospatial Intelligence Agency (Proposed)
St. Louis, Missouri
SCI No. 2015-0461.21

Dear Mr. March:

SCI Engineering, Inc. (SCI) is pleased to submit this summary report for the National Geospatial Intelligence Agency in St. Louis, Missouri from January 18 through January 22, 2016. Per the approved scope of work dated December 10, 2015, SCI has been providing soil and groundwater sampling activities, trenching, and a ground penetrating radar survey for the subject site. During the above-referenced time period, SCI was onsite for four working days. A detailed summary for each site activity during this period is described herein. The enclosed drawing includes actual and proposed boring locations for the subject site.

**SOIL AND GROUNDWATER SAMPLING**

SCI has completed all accessible borings on the subject site, for a total of 68 borings. Per discussions with the City of St. Louis, borings SCI-18, SCI-19 (inaccessible due to fencing), SCI-72 through SCI-74, and SCI-76 (inaccessible due to building access) were removed from the scope of work. Previously, borings SCI-56, SCI-60, and SCI-62 were removed from the scope of work per discussions with MDNR.

SCI mobilized to the site on January 18 to collect groundwater samples from the remaining piezometers on site. All samples were collected with the exception of SCI-35 and SCI-36, which did not produce sufficient water for sampling. When available, SCI will provide the analytical data from the groundwater samples.

**TRENCHING ACTIVITIES**

From January 18 through January 22, 2016, SCI completed 19 trenches. During this time, approximately 2,600 feet of trenching was completed. At this time, SCI has completed trenching activities on site, for a total of 65 trenches totaling approximately 12,500 feet of trenching. Per discussions with MDNR and the City of St. Louis, two trenches (T-15 and T-18) were removed from the scope of work due to structures located within the proposed trench area.

Material observed in the trenches was visually assessed for the presence of suspect asbestos containing materials (ACMs), and samples were collected when identified. To date, 176 bulk samples have been collected of suspect ACMs. Of the 176 bulk samples, a total of 101 bulk samples have been submitted to the laboratory, resulting in the analysis of 157 individual samples/layers of suspect ACM. As only 157 samples/layers were included in the proposed scope of work, the additional 19 bulk samples are on "hold" pending financing approval from the MDNR. SCI is in the process of preparing an addendum to the scope of work which will allow for the analysis of additional suspect ACMs.

**GROUND PENETRATING RADAR (GPR) SURVEY**

All GPR activities required in the approved scope of work were completed on January 7, 2016 and summarized in SCI's Progress Update Report dated January 11, 2016. No further GPR activities are anticipated.

**SCHEDULE**

For the week of January 18, SCI experienced one lost day due to snowfall. SCI maintains the project schedule of a draft report issuance no later than February 12, 2015. Field work has been completed on the subject site. Therefore, this will be the final progress report issued for the proposed scope of work. SCI will continue to provide analytical results when they are made available.

SCI appreciates being of continuing service to you on this project. Please contact us if you have any questions or concerns regarding this report.

Respectfully,
**SCI ENGINEERING, INC.**

Dear Ben Butterfield:

TEKLAB, INC received 29 samples on 1/13/2016 5:10:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Michael L. Austin
Project Manager

## Abbr Definition

| | |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

Dear Ben Butterfield:

TEKLAB, INC received 29 samples on 1/12/2016 4:50:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Michael L. Austin
Project Manager
(618)344-1004 ex 16

**Client Project:** NGA 2015-0461.21 **Report Date:** 19-Jan-16

## Abbr Definition

| | |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

Dear Ben Butterfield:

TEKLAB, INC received 20 samples on 12/18/2015 5:18:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

# Definitions

**Client:** SCI Engineering, Inc. **Work Order:** 15121421

**Client Project:** NGA 2015-0461.21 **Report Date:** 28-Dec-15

| Abbr | Definition |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |

*Surrogate recovery is outside QC limits due to matrix interference.*

*LCS & LCSD recovered outside upper QC limits for acetone. Sample results are below reporting limit. Data is reportable per 2009 TNI Standard (Volume1, Module 4, section 1.7.4.2).*

Dear Ben Butterfield:

TEKLAB, INC received 24 samples on 12/21/2015 4:35:00 PM for the analysis presented in the following report.

Samples are analyzed on an as received basis unless otherwise requested and documented. The sample results contained in this report relate only to the requested analytes of interest as directed on the chain of custody. NELAP accredited fields of testing are indicated by the letters NELAP under the Certification column. Unless otherwise documented within this report, Teklab Inc. analyzes samples utilizing the most current methods in compliance with 40CFR. All tests are performed in the Collinsville, IL laboratory unless otherwise noted in the Case Narrative.

All quality control criteria applicable to the test methods employed for this project have been satisfactorily met and are in accordance with NELAP except where noted. The following report shall not be reproduced, except in full, without the written approval of Teklab, Inc.

If you have any questions regarding these tests results, please feel free to call.

Sincerely,

Shelly A Hennessy

Shelly A. Hennessy

# Definitions

**Client:** SCI Engineering, Inc. **Work Order:** 15121500

**Client Project:** NGA 2015-0461.21 **Report Date:** 28-Dec-15

| Abbr | Definition |
|---|---|
| CCV | Continuing calibration verification is a check of a standard to determine the state of calibration of an instrument between recalibration. |
| DF | Dilution factor is the dilution performed during analysis only and does not take into account any dilutions made during sample preparation. The reported result is final and includes all dilutions factors. |
| DNI | Did not ignite |
| DUP | Laboratory duplicate is an aliquot of a sample taken from the same container under laboratory conditions for independent processing and analysis independently of the original aliquot. |
| ICV | Initial calibration verification is a check of a standard to determine the state of calibration of an instrument before sample analysis is initiated. |
| IDPH | IL Dept. of Public Health |
| LCS | Laboratory control sample, spiked with verified known amounts of analytes, is analyzed exactly like a sample to establish intra-laboratory or analyst specific precision and bias or to assess the performance of all or a portion of the measurement system. The acceptable recovery range is in the QC Package (provided upon request). |
| LCSD | Laboratory control sample duplicate is a replicate laboratory control sample that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MBLK | Method blank is a sample of a matrix similar to the batch of associated sample (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples through all steps of the analytical procedures, and in which no target analytes or interferences should present at concentrations that impact the analytical results for sample analyses. |
| MDL | Method detection limit means the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero. |
| MS | Matrix spike is an aliquot of matrix fortified (spiked) with known quantities of specific analytes that is subjected to the entire analytical procedures in order to determine the effect of the matrix on an approved test method's recovery system. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MSD | Matrix spike duplicate means a replicate matrix spike that is prepared and analyzed in order to determine the precision of the approved test method. The acceptable recovery range is listed in the QC Package (provided upon request). |
| MW | Molecular weight |
| ND | Not Detected at the Reporting Limit |
| NELAP | NELAP Accredited |
| PQL | Practical quantitation limit means the lowest level that can be reliably achieved within specified limits of precision and accuracy during routine laboratory operation conditions. The acceptable recovery range is listed in the QC Package (provided upon request). |
| RL | The reporting limit the lowest level that the data is displayed in the final report. The reporting limit may vary according to customer request or sample dilution. The reporting limit may not be less than the MDL. |
| RPD | Relative percent difference is a calculated difference between two recoveries (ie. MS/MSD). The acceptable recovery limit is listed in the QC Package (provided upon request). |
| SPK | The spike is a known mass of target analyte added to a blank sample or sub-sample; used to determine recovery deficiency or for other quality control purposes. |
| Surr | Surrogates are compounds which are similar to the analytes of interest in chemical composition and behavior in the analytical process, but which are not normally found in environmental samples. |
| TIC | Tentatively identified compound: Analytes tentatively identified in the sample by using a library search. Only results not in the calibration standard will be reported as tentatively identified compounds. Results for tentatively identified compounds that are not present in the calibration standard, but are assigned a specific chemical name based upon the library search, are calculated using total peak areas from reconstructed ion chromatograms and a response factor of one. The nearest Internal Standard is used for the calculation. The results of any TICs must be considered estimated, and are flagged with a "T". If the estimated result is above the calibration range it is flagged "ET" |
| TNTC | Too numerous to count ( > 200 CFU ) |

## Qualifiers

| | | | |
|---|---|---|---|
| # - | Unknown hydrocarbon | B - | Analyte detected in associated Method Blank |
| E - | Value above quantitation range | H - | Holding times exceeded |
| I - | Associated internal standard was outside method criteria | J - | Analyte detected below quantitation limits |
| M - | Manual Integration used to determine area response | ND - | Not Detected at the Reporting Limit |
| R - | RPD outside accepted recovery limits | S - | Spike Recovery outside recovery limits |
| T - | TIC(Tentatively identified compound) | X - | Value exceeds Maximum Contaminant Level |
