Background

Barr Engineering Co. completed a Hazardous, Toxic, and Radioactive Waste Assessment (HTRW Assessment) for the Napa Valley and Forest Road Segments of the Mouse River Enhanced Flood Protection Project (Project) Minot, Ward County, North Dakota. The Project consists of multiple flood protection features from Burlington through south of Minot (Figure 1). This HTRW Assessment focuses on the Project features to be constructed in the Napa Valley and Forest Road segments of the Project; these segments are referred to as the Assessment Area, where construction of new levees, road raises and realignments, overbank excavation, and related utility relocations are planned as part of the Project. The HTRW Assessment area was established around planned Project elements including a buffer of approximately 50 feet (the Assessment Area see Figure 2) to account for temporary construction areas. The following resources were used to obtain information on the Assessment Area: a site inspection visit, historical maps, historical aerial photographs, a regulatory database report review, and interviews with select Minot staff.

Barr performed this HTRW Assessment in general conformance with ER 1156-2-132 U.S. Army Corps of Engineers Water Resources Policies and Authorities, Hazardous, Toxic, and Radioactive Waste Guidance for Civil Works Projects (Ref. 14). This narrative summarizes the results of the HTRW Assessment. The Assessment Area's setting, land-use history, regulatory history, and features, as well as information related to interviews and information resources, are presented in the HTRW Assessment documentation in Appendix A. Historical documentation is in Appendix B. Site visit photographs are in Appendix D. Reference numbers cited throughout this report and in Appendix A correlate to the numbers listed with the information resources in Appendix E.

1.0 Assessment Area Setting

The Napa Valley and Forest Road segments are adjacent to the Mouse River in west Minot. Napa Valley and Forest Road are two Project segments that have been combined into one Assessment Area for this review due to their proximity. Project elements for Napa Valley include the construction of approximately one mile of levees along the northern side of the Mouse River through the Souris Valley Golf Course and Wee Links Golf Course and associated road raises and realignments. Project elements for Forest Road include the construction of levees on both banks of an approximately half-mile reach of the Mouse River and overbank excavation between the levees. Current surface elevations of the Assessment Area range from approximately 1,550 to 1,570 feet above mean sea level (Ref. 1).

There are 112 parcels within the Assessment Area: 47 are owned by Minot, 11 by the Minot Park District and 54 are privately owned. A comparison between aerial photographs and site inspection observations show that numerous buildings have been demolished on parcels owned by Minot. As of May 17, 2015, there are approximately 60 buildings within the Assessment Area; including 21 buildings (residential, maintenance sheds and businesses) 28 mobile homes and 11 buildings marked "No Trespassing – City of Minot".

The Site is located in the floodplains of the Mouse River Basin, carved into late Wisconsin age glacial drift during the draining of Glacial Lake Regina, in Saskatchewan, Canada. Floodplain alluvial deposits, generally mapped across the extent of the Souris River Valley Floodplain, consist of fluvial channel and overbank sands, gravels, silts, and clays (Refs. 21, 22). The floodplain alluvial deposits varying in thickness from approximately 50 to 200 feet thick (Ref. 20). At the margins of the floodplain, colluvial fan deposits of sandy and silty clay originate from the mouths of coulees and ravines (Ref. 22).

Bedrock underlying the Assessment Area is the Cannonball Formation, consisting of alternating sand, shale, poorly consolidated sandstone and mudstone (Refs. 5, 20). The Cannonball Formation is within the lower part of the Fort Union Group with is regionally present in the vicinity of the Assessment Area (Ref. 5). The depth to bedrock underling the Assessment area is approximately 95 to 135 feet below ground surface (below ground surface), ranging from approximately 1,455 to 1,435 feet above mean sea level (Ref. 19).

Barr conducted a geotechnical drilling investigation from February through April 2015 in Minot, which included several borehole locations within the Assessment Area as shown on Figure 3. Drilling observations indicate sand and clay fill across the Site from depths of 2 to 16 feet bgs. Other than plastic debris at 7 feet bgs at boring SB-27-15, located near the Sixteenth Street bridge, no debris was observed within the fill. Field staff observed saturated soils ranging from approximately 8 to 21 feet bgs.

Minot provides potable water to residents in the Assessment Area from public water supply wells (Refs. 10, 16, 17). Prior to connecting to Minot's water supply, residents and businesses within the Assessment Area used private wells (Ref. 10). Per a Minot ordinance, all residents within the city limits must be connected to Minot's water supply system (Ref. 10).

The nearest surface water body is the Mouse River located south of the Napa Valley segment and bisecting the Forest Road segment (Ref. 1). The Mouse River originates in Canada; it flows southeasterly through North Dakota before bending northwards into Manitoba, Saskatchewan (Ref. 6).

The Assessment Area is within the Hudson Bay Drainage (Ref. 19). The Minot Aquifer underlies the Assessment Area (ref. 21). The Minot aquifer is comprised of glacial fluvial deposits of sand and gravel and in many places boulders, the grain size varies greatly vertically and horizontally (Ref. 21). The Minot aquifer commonly ranges from 30-50 feet thick (Ref. 21).

The historical groundwater flow direction within the Assessment Area is anticipated towards the Mouse River (Refs. 1, 7). Therefore, between the Highway 83 bypass to the west and the Sixteenth Street SW bridge groundwater flow is anticipated to be towards the south. From the Sixteenth Street SW bridge to the eastern extent of the Assessment Area groundwater flow is anticipated to be either northwest or northeast depending on which bank of the Mouse River the groundwater originates from. However, due to pumping from public water supply wells, shown on Figure 3, groundwater flow direction reverses away from the river and towards the public water supply wells in the area (Ref. 7). The public water supply wells in the Mouse River valley obtain water from the Minot Aquifer (Refs. 10, 16) and Sundre Aquifer (Ref. 16). Therefore, the groundwater flow direction varies and for the purposes of this HTRW Assessment it is assumed that all sites listed in the regulatory database report that are between Mouse River and the public water supply wells are potentially upgradient.

2.0 Land-Use History and Current Conditions

In 1886, the Great Northern Railroad ended its development in the state of North Dakota for the winter, after having difficulty constructing a trestle across Gassman Coulee (Ref. 18). A tent town sprang up overnight and the town was named after Henry Davis Minot, a railroad investor (Ref. 18). The city was incorporated on June 28, 1887 (Ref. 18). The town started out as a western town, and additional development occurred in the 1950s; census data records a population of 22,032 (Ref. 18). In 1969, a severe flood on the Mouse River devastated Minot and the U.S. Army Corps of Engineers straightened the river through the city and built several flood control structures (Ref. 18). The 2010 census data records a population of 40,888 (Ref. 18). The Assessment Area has a variety of zoning including P, public land; R1 single family; R2 two family; M1 light industrial; and AG (Agricultural) (Ref. 13).

2.1 Assessment Area History

Topographic maps and aerial photographs from 1928 through 1953 indicate what appears to be undeveloped or agricultural land within the Assessment Area (Refs. 1, 3). In 1953 residential development began in the eastern portion of the Assessment Area, along the right bank of the Mouse River. A single residence is visible at the western edge of the Assessment Area. The Minot Water Treatment Plant is also evident in the photographs.

During the 1960s, residential development occurred along the banks of the Mouse River in the eastern portion of the Assessment Area. A gravel pit, to the northwest of the Assessment Area, and the Sixteenth Street SW bridge are visible by 1961. A school, north-adjacent to the Assessment Area, and the Souris Valley golf course are visible by 1969.

Between 1969 and 1979 residential development continued throughout the eastern and central portions of the Assessment Area, while the western portion remained agricultural. By 1979, the Mouse River within the western portion had been straightened for the construction of the U.S. 83 Bypass; and the northeastern portion of the river had been straightened at the northeastern corner of Assessment Area and passed under the railroad tracks. The single residence at the western edge of the Assessment Area from 1953 is no longer visible.

From 1979 until 2014, residential development slowed, but continued to spread westward throughout the Assessment Area. In 2003 the Wee Links golf course opened (Refs. 3, 18). In 2009, the Jack Hoeven Park (baseball fields) and Dakota Bark Park (dog park) (Ref. 18) are visible on the western portion of the Assessment Area. Between 2009 and 2014, some residences along the western and eastern banks of the Mouse River in the Forest Road neighborhood are no longer visible.

2.2 Current Conditions

The western portion of the Assessment Area is public land (two city owned golf courses, walking trails and a dog park) (Refs. 11 and 18) and the eastern portion is residential land (from the eastern edge of Wee Links golf course to the eastern boundary of the Assessment Area) (Ref. 18). As of May 17, 2015, there were approximately 11 buildings marked as "No Trespassing – City of Minot".

A site inspection was completed for the HTRW Assessment, on March 17, 2015, from public rights-of-way. No buildings or residences were entered and inspected. Figure 4 shows notable findings and uses identified in the Assessment Area during the site inspection, including a pole mounted transformer, utility manholes, residential propane above-ground storage tanks (ASTs), a power generator, and debris in the trees.

The following notable items were observed in the vicinity of the Assessment Area: vent pipes at the Minot Water Treatment Plant and at least nine empty 55-gallon drums at the Minot Moose Lodge Family Center #822. No staining or stressed vegetation was observed near vent pipes. The drums were not dented or bulged and did not contain any liquids or other substances.

3.0 Regulatory History

A search of regulatory records for the Assessment Area was obtained from Historical Information Gatherers, Inc. (HIG) on March 10, 2015. The HIG regulatory database report (HIG Report) is in Appendix C. No potentially contaminated sites were listed in the regulatory database report for the Assessment Area.

Several regulated sites were identified in the HIG report as potentially adjacent to or upgradient of the Assessment Area (Ref. 9). Seventy unmappable sites (i.e., sites that could not be definitively located by HIG) were listed in the HIG Report. None of the unmappable sites were determined to be adjacent to or up-gradient of the Assessment Area (Ref. 9). Additional details regarding the regulatory history of surrounding properties are included in Appendix A and Appendix C.

4.0 Previous Environmental Investigations

No previous environmental investigations were discovered or reviewed for the Assessment Area.

5.0 Findings

The following is a list of notable observations and findings that may present an environmental risk as part of the Project implementation. Select photographs from the site inspection are in Appendix D. Further documentation of HTRW findings is provided in the HTRW Assessment Documentation in Appendix A.

- Current non-residential uses in the Assessment Area include the walking path, Dakota Bark Park, Souris Valley Golf Course, and Wee Links Golf Course. No evidence of barrels or stressed vegetation was observed in any of these areas.
- Odd's Mobile Home Park is within the northeastern corner of the Assessment Area.
 - Above-ground storage tanks (ASTs) similar in size and shape to typical propane and/or residential fuel oil storage tanks were observed within the Assessment Area at approximately 20% of the residences at Odd's Mobile Home Park.
 - A debris pile was observed in the woods to the west of Odd's Mobile Home Park. No staining, distressed vegetation, or barrels were observed near the debris pile.
- One business, Curt's Starter and Alternator Service, was observed at a residential property (1304 Third Avenue SW).
 - One AST similar in size and shape to typical propane was observed at 1304 Third Avenue SW. No vegetative stress was observed from the public right-of-way in the vicinity of the tank.
- One city-owned generator was observed near the southern end of Twenty-First Street SW. The generator is used as backup power for a sanitary sewer lift station that was installed during 2014 (Ref. 10). No staining or distressed vegetation was observed near the generator.
- One pole-mounted transformer and one electrical box were observed in the Assessment Area. There was no evidence of staining near either of these electrical units and the presence of polychlorinated biphenyls (PCB) usage was not observable from the public right-of-way.
- Based on geotechnical investigation observations, fill soil related to site grading and landscaping exists across the Assessment Area. A minor amount of fill with debris was observed within the shallow soils south the Sixteenth Street SW bridge.

In areas nearby the Assessment Area:

- At least nine 55-gallon metal drums, labeled as resin, were observed on the parking lot of the Moose Lodge Family Center #822, on a property east-adjacent to the Assessment Area. There is no known chemical storage occurring at this property (Ref. 10). The drums appeared empty and no staining was observed. The drums were not dented or bulged and did not contain any liquids or other substances.

6.0 Conclusions

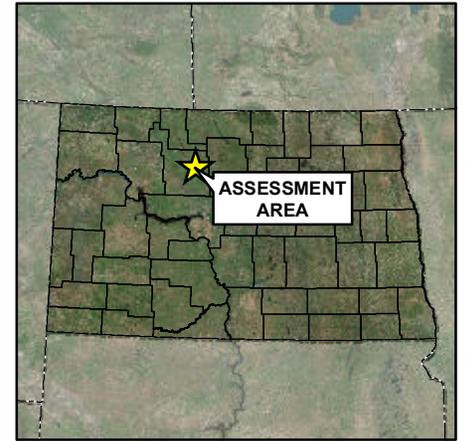

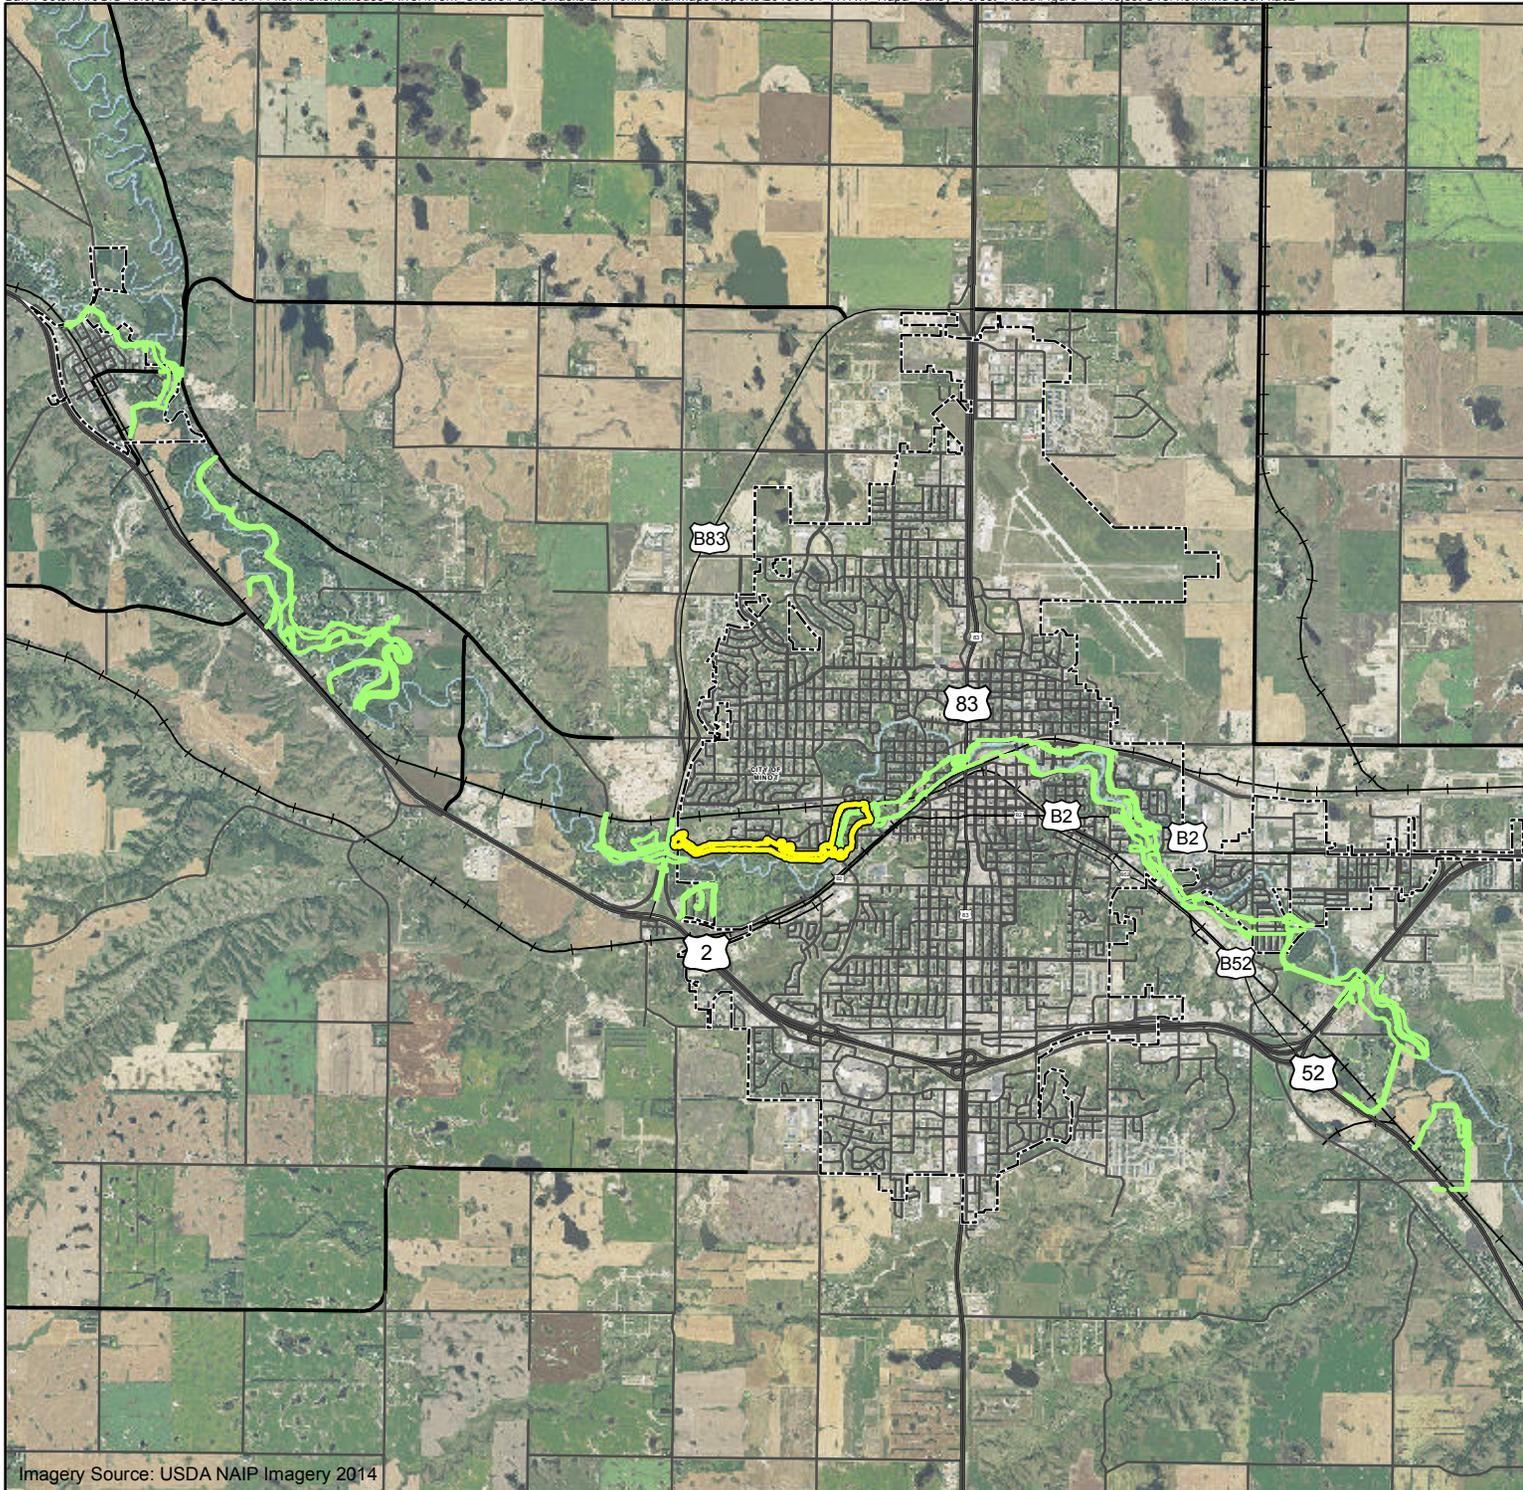

Barr performed this HTRW Assessment in conformance with the HTRW guidelines. Company qualifications, special terms, conditions, limitations, and exceptions that apply to the Assessment are described in Appendix G.

The following environmental risks were identified as having the potential to adversely affect the Project:

- Due to the age of the approximately 60 buildings present in the Assessment Area, it is possible that hazardous building materials (such as asbestos-containing material (ACM) and lead-based paint) could have been used during construction. Also, older buildings could have had heating oil storage, wells, septic systems, or other concerns. Although the HTRW did not involve building walkthroughs or interviews with owners, an inventory of such items should be conducted in the future at buildings to be demolished and any identified environmental concerns should be addressed/abated/sealed/etc. prior to demolition in accordance with applicable local, state, and federal requirements.
- Debris is present in some areas in the shallow fill soil, including plastic fragments. If the Project involves excavation into these areas, then the excavated materials may require further evaluation to determine whether the extent of the debris represents a concern for reuse of the soil within the Project area, and/or for potential export to off-site locations. If areas of the excavation encounter a significant concentration of debris, then it may be necessary to segregate the excavated debris materials from these areas for transport to a landfill. Excavation of debris areas should be monitored by an environmental professional to verify that the debris are consistent with the type of materials observed in the geotechnical investigations (plastic).

In addition to the above risks, it is recommended that work crews implementing the Project always be alert to the possibility that unexpected hazardous substances or petroleum products may be encountered which were not identified by the HTRW Assessment, especially given the urban setting and long land use history in the Assessment Area. Appendix F provides a Contingency Plan that can be used to guide actions in the event that unanticipated environmental conditions are encountered during construction of the Project.

Area Information

Township/range/section:	T155N, R83W, Sections 21, 22, 23
Area Use:	Permanent residences, mobile home community, golf courses, a public walking path, and a dog park.
Approximate Levee Length and proposed construction features:	<u>Napa Valley:</u> Ponding Area (Existing) – 0.46 acres Pump Station – One Floodwall / Transportation Closure – 163 feet Levee Centerline: 5,767 feet Road Realignment (far west): 517 feet Road Realignment (east): 493 feet Road Realignment (center): 1,170 feet <u>Forest Road:</u> Overbank Excavation – 15.2 acres Levee Centerline (north): 2,292 feet Levee Centerline (south): 1,492 feet
Zoning:	The Assessment Area is zoned P (Public Land), R1 (Single Family), R2 (Two-Family), AG (Agricultural), and M1 (Light Industrial) (Ref. 13).

The properties included in the HTRW Assessment are shown on Figure 2 and are collectively referred to as the “Assessment Area” throughout this appendix and report.

Utility Service

Municipal water supply:	City water comes from wells located in Minot that are screened in the Minot aquifer. Additional water comes from wells located 6 miles SE of Minot that are screened in the Sundre aquifer (Ref. 10).
Property potable/process water supply:	The Assessment Area receives its potable water from the Minot (Ref. 10). One observation well is located on the Assessment Area (Ref. 17). This well and additional wells and test holes nearby are shown on Figure 4.
Historical water supplies:	Prior to connecting to the Minot’s water supply, properties within the Assessment Area used private wells (Ref. 10). Per a Minot ordinance, all residents within the city limits must be connected to Minot’s water supply system (Ref. 10).
Type of sanitary service:	Sanitary service is provided by Minot; however, private septic systems may be hooked up to Minot’s system (Ref. 10).
Onsite septic system or drainfields:	None reported (Ref. 10) or observed.

Regulatory Data

A regulatory database report was obtained by Historical Information Gathers (Ref. 9). No sites were listed in the regulatory database report for the Assessment Area.

One Air Permit (AIRS) and Registered Storage Tank (RST) site (Minot Water Treatment Plant) was listed in the regulatory database report and appears to be located potentially upgradient of the Assessment Area (Ref. 9). All of the other listings, located potentially upgradient of the Assessment Area were listed in the Facility Registry System (FRSND).

Assessment Area Land-Use History

The Assessment Area has mainly been used for agricultural and residential uses since at least 1928 (Refs. 1, 3).

The nonresidential uses identified in the Assessment Area include two golf courses, a dog park, a public walking path and baseball field complex (Refs. 3, 11). No demolition debris was evident in the Assessment Area during the site inspection visit performed as part of this HTRW Assessment (Ref. 11). The area has not changed significantly since 1928, with the exception of additional residential housing development over time (Refs.1, 3).

Nearby Area Land Use

Direction	Historical	Current
North	Undeveloped, agriculture, and railroad tracks (Ref.3)	Residential and railroad tracks
South	Undeveloped and agriculture (Ref. 3)	Residential, Minot Water Treatment Plant, public land (golf courses)
East	Residential and undeveloped (Ref. 3)	Residential and light industrial
West	Residential, undeveloped, and Highway Bypass 83 (Ref. 3)	Residential and Highway Bypass 83

Assessment Area Structures (Current and Historical)

Approximate Number of Structures	Types of Area Structures	Issues Associated with Levee Construction	Notes
Residences and associated garages/sheds are apparent in the current aerial photograph and were observed onsite during the site inspection visit (Ref. 11). As of May 17, 2015 there are approximately 60 buildings present within the Assessment Area.	Residential	Lots that are currently occupied and slated for demolition as part of the levee construction will need to have (if present) septic tanks, fuel tanks, transformers, hazardous building materials, wells, and any remaining debris removed prior to levee construction.	Some residential properties appear to have been recently demolished (Ref. 3), No businesses, debris or car repair operations were observed within Odd's Mobile Home Park (Ref. 11). One business, Curt's Starter and Alternator Service, was observed at 1304 3 rd Ave. SW.
Two buildings. The First Tee facility building and a building associated with the Wee Links Golf Course were observed onsite during the site inspection visit (Ref. 11).	Youth Golf Facility and Storage	Any septic tanks, fuel tanks, transformers, hazardous building materials, wells, or remaining debris, present at buildings that are currently occupied and slated for demolition as part of the levee construction will need to be removed prior to levee construction.	

Exterior Observations

A site inspection visit was performed on March 17, 2015; associated observations and methods are described in the following table, and shown on Figure 3. Photographs taken during the site inspection visit are in Appendix D. Building interiors were not inspected.

Observation Method	The Inspector walked transects along the Mouse River on the public walking path from east of the Highway 83 bypass to The First Tee learning facility parking lot, and on worn trails along the dike on both sides of the river from the 16 th St. SW bridge to the Canadian Pacific railroad bridge. The inspector also drove along all public streets intersecting the Assessment Area.
Access to the Assessment Area	Access was only available from public rights-of-way.
Periphery of the Assessment Area	The Assessment Area extends from within 900 feet of the Mouse River between the Highway 83 bypass to the west and the 18 th Street SW bridge. The Mouse River bisects the Assessment Area continuing east of the 18 th Street SW bridge up to the eastern extent of the Area. Surrounding parcels are owned by public and private entities.
Ground surface cover:	Mixture of parking lots, groomed golf courses, residential lots, and paved or gravel driving/parking surfaces. Vegetation immediately adjacent to river is not trimmed.
Filling, excavation, vegetative stress, burned areas:	None observed.
Pits, ponds, and lagoons:	Stormwater ponds were observed near the north-adjacent Dakota Bark Park (dog park).

Stained soil or pavement:	None observed.
Wastewater, other liquid discharge into a drain, ditch, stream or adjacent property:	None observed.
Wells:	None observed.
Pipelines:	None observed.
Rail lines:	Burlington Northern Santa Fe Railroad was observed to the south of the Mouse River and the Assessment Area. The Canadian Pacific Railroad was observed to the north of the Assessment Area.
Transformers:	One pole mounted transformer was observed near the eastern side of the river between 6 th and 8 th Avenues SW. No evidence of staining or evidence of PCB usage were observable from the public right-of-way.
Other:	Vent pipes were observed south-adjacent of the Assessment Area at the Water Treatment Plant Facility. No evidence of staining was observable from the public right-of-way. A debris pile was observed in a wooded area west of Odd's Mobile Home Park. No vegetative stress or barrels were observed at the debris pile.

USTs/ASTs/Outdoor Chemical Storage Areas

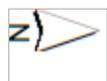

Type (AST, UST, Drums)	Location, Size, Age, Condition, Registration	Containment Devices/ Structures	Runoff Management/ Sumps/Drains	Materials Currently Stored
AST	Less than five ASTs were observed at residential properties within the Assessment Area; tanks were primarily located within Odd's Mobile Home Park. No evidence of staining was observable from the public right-of-way.	Unknown	Unknown	Propane
UST	None observed.			
Drums	Less than ten 55-gallon drums were observed at the Moose Lodge Family Center #822 parking lot, east of the Assessment Area. The drums were empty and rusty. No obvious staining of the parking lot was observed. Drums did not appear to be actively used for chemical storage (Ref. 11).	Unknown	Unknown	A worn resin label was observed.
Barrels	None observed.			
Cylinders	None observed.

Appendix F
Contingency Plan

Appendix F
Site Contingency Plan
Napa Valley-Forest Road
June 2015

Barr Engineering Co. completed a Hazardous, Toxic, and Radioactive Waste Assessment (HTRW Assessment) of the Flood Protection Project (Project) located in the City of Minot, Ward County, North Dakota. This HTRW Assessment focuses on the Napa Valley and Forest Road segments, where construction of a new floodwall, levee, transportation closures and related utility relocations are planned as part of the Project (Assessment Area)

Barr performed this HTRW Assessment in general conformance with ER 1156-2-132 U.S. Army Corps of Engineers Water Resources Policies and Authorities, Hazardous, Toxic and Radioactive Waste Guidance for Civil Works Projects.

The HTRW reported a number of findings including: a number of above ground storage tanks (AST), a surface debris pile, transformers and generator, and fill with inert debris located upgradient, or adjacent to, the Assessment Area, No fuel oil tanks, vent pipes, leaking transformers, or other sources of hazardous materials or petroleum products were observed.

1.0 Introduction and Purpose

This Site Contingency Plan will be used if contamination is encountered during construction activities on the site.

During construction activities, the people involved need to be alert to the possibility that unexpected hazardous substances or petroleum products may be encountered. If unexpected hazardous substances or petroleum products are encountered during construction activities, the parties onsite will need to make decisions on short notice. These decisions potentially have serious impacts and consequences. To help ensure that situations are handled properly, personnel involved in construction-related activities must be trained in the immediate recognition of a wide range of potential hazards and be ready to respond in accordance with a previously prepared general plan of action. Such a plan is commonly referred to as a Site Contingency Plan.

This Site Contingency Plan is a stand-alone document. A copy will be available at the site during construction activities and individuals onsite that are responsible for managing the construction activities, especially those involving excavation work, will be provided with a copy and be familiar with its contents.

The manager of the construction project will be responsible for being informed regarding the philosophy behind and the content of this Site Contingency Plan. The construction manager must also be responsible for informing the onsite workers involved with excavation activities about actions to be taken if contingent situations described in this plan are encountered. The need for taking appropriate actions should also be reinforced in daily safety meetings held at the site.

Contingent conditions that may be encountered could include uncovering an unknown underground storage tank, a water well or vent pipe, debris, containers, contaminated soils, or contaminated water that accumulates in the excavation. These and other unexpected conditions will be addressed according to the procedures described in this Site Contingency Plan.

Obvious signs of contamination in a contingency situation can include:

- Strong or unusual chemical odors during excavation (e.g., solvent, petroleum, etc.).
- Encountering industrial wastes such as tar, sludge, semisolids, powders, resins, or ash.
- Discolored soil that is different than encountered elsewhere on the site.
- Drums and/or containers.
- Buried debris such as metal scrap, cans, jars, brick, concrete, asphalt, trash, or wood.
- Objects such as vent pipes or wells.
- Asbestos-containing materials.
- Persons who suddenly become ill at the site (keep in mind that certain hazardous substances such as methane gas which is odorless and colorless cannot be detected visually or by smell).

2.0 Initial Actions

If the items above are observed during earthwork activities, the following actions must be taken:

1. IMMEDIATELY STOP WORK IN THE AREA OF UNEXPECTED CONTAMINATION, PROVIDE FOR WORKER SAFETY, AND SECURE THE AREA
2. Contact the property owner or other person responsible for overseeing the construction project if that person is onsite or contact the office project manager
3. Do not rebury the hazardous substances or petroleum products that are encountered. The area of any exposed hazardous substances or petroleum products must be secured

3.0 Assessing the Situation

An environmental professional will be responsible for inspecting the area of contamination or contingent situation and developing a plan of action that is consistent with this Site Contingency Plan. This may involve implementing measures to further secure the area (e.g., installing fencing or posting warning signs), collecting samples to identify the type and magnitude of contamination that is present, and placing test pits to help define the extent of contamination that is present.

The environmental professional responsible for managing the contingency situation or the client representative will contact the appropriate North Dakota Department of Health (NDDH) representative to

make them aware of the situation and to determine the process for NDDH input and review of the plan to assess and manage the contingent action.

Once work in the area has stopped, the work site has been secured, the notification process has been implemented, the situation has been adequately assessed, and a plan of contingent action has been established, a OSHA HAZWOPER-trained contractor with properly trained or certified work crews (for issues such as tank removal, asbestos containing materials handling, hazardous waste management, water well abandonment, etc.) will implement the contingent action plan. Activities implemented through the Site Contingency Plan will only be performed by OSHA HAZWOPER-trained personnel with the proper licensing for any specialty work and under a Project Health and Safety Plan (PHASP) that will be prepared for the contingent action. The original onsite contractor will be allowed to continue work on portions of the site that are not involved with the contingency situation.

4.0 Contingent Actions

The following paragraphs describe the general contingent actions that will be taken in the event that contamination or other contingent conditions are encountered during project construction.

Specific requirements for the OSHA HAZWOPER-trained contractor as they relate to the implementation of contingent actions may include erosion control, runoff and runoff controls, air emission controls, decontamination facilities, notification procedures, construction on temporary contaminated soil stockpile area, and contaminated media profiling and treatment/disposal.

4.1 Contaminated Soils (not a RCRA-regulated hazardous waste)

Soils potentially containing hazardous substances or petroleum products may be encountered during earthwork activities associated with site construction. If, based upon visual or olfactory evidence, such materials are encountered during earthwork activities, excavation of the impacted area will cease until the appropriate regulatory agency is notified, samples are collected, results are reviewed, and a plan of action is developed as described in Sections 2.0 and 3.0 of this Site Contingency Plan.

General requirements are described in the following paragraphs.

- An environmental professional familiar with site conditions and the plan for contingent action will be present during excavation of contaminated soils to screen and classify the soils (based on appearance, odor and organic vapor headspace measurements) and to collect analytical samples for further characterization and for sidewall and base of excavation verification.
- A contaminated soil stockpile area will be constructed onsite by creating an impervious surface by placing plastic sheets (minimum 10-mil) on the ground or similar. A plastic cover (minimum 10-mil) will be placed over the stockpiled materials at the end of each work day and after excavation is complete and will be held in place with weights such as tires, bags of sand or clean soil. All plastic sheets will overlap at least 3 feet at seams. The contractor will be instructed to control all runoff from the stockpile area.

- After field screening indicates that the limits of the contaminated soil has been reached, soil samples will be collected from the base and sidewalls of the excavation in accordance with NDDH Cleanup Action Levels for Gasoline and Other Petroleum Hydrocarbons dated Dec, 2006 (<http://www.ndhealth.gov/wm/Publications/CleanupActionLevelsForGasolineAndOtherPetroleumHydrocarbons.pdf>) or in accordance with the verification sampling plan negotiated with the regulatory agency for the contingent action. Soil samples will be analyzed for the appropriate parameters designated by the environmental professional in consultation with the NDDH based on the likely source and type of contamination and field observations. The results from the analysis of the verification samples will be compared to NDDH risk-based screening levels consistent with the land use anticipated for the site. Unless otherwise described in the plan for contingent action, the intent will be that excavation of contaminated soil will continue until appropriate risk-based cleanup levels are attained. The NDDH will be consulted regarding any issues associated with an inability to meet appropriate risk-based cleanup levels.
- Soil samples from the stockpiled contaminated soil will be collected in accordance with NDDH guidance such as NDDH's Investigations of Contaminant Release Sites dated November 2006 (<http://www.ndhealth.gov/wm/Publications/InvestigationsOfContaminantReleaseSites.pdf>) and as necessary to complete waste profiling for disposal purposes after the material has been excavated. A plan for disposing of or otherwise managing the stockpiled soils will be prepared after the results from all the sampling are available.

4.2 RCRA-Regulated Hazardous Waste

Materials that are characterized as a RCRA-regulated hazardous waste and that are generated in the initial excavation will be containerized and temporarily stored onsite on an impervious surface in a secured area until disposal arrangements are determined. If practicable, the remaining hazardous waste will be left in place until disposal arrangements are made. The area of contamination must be secured with fencing and posted with warning signs. Storage on the site will not exceed duration of 120 days once the material has been determined to be a hazardous waste.

All hazardous wastes will be stored, transported, treated and disposed of in accordance with all applicable rules and regulations. The general requirements for construction of the storage area, waste characterization, and confirmation sampling will be implemented as described in 4.1 of this section.

4.3 Buried Drums or Containers

If drums or containers are encountered, they will be individually removed and their condition assessed. If the excavated drums and containers are not in good condition (e.g., severe rusting, structural defects, leaking, etc.), contents will be transferred to new drums, overpacks, or U.S. Department of Transportation (DOT)-approved containers. These containers will meet the appropriate requirements of U.S.DOT, OSHA and U.S.EPA regulations for the applicable materials.

Intact and repacked drums and containers will be transported to an onsite, secure, impervious storage area and/or placed in roll-off boxes. If appropriate, liquids may be removed from drums and containers and bulk-stored in tanks. Roll-off boxes will be lined to contain accumulated materials. The unused

volume in the roll-off boxes will be sufficient to contain 10 percent of the volume of the drums or the volume of the largest container, whichever is greater. The roll-off boxes will be covered to prevent collection of precipitation.

Samples will be collected from the drums/containers and analyzed as appropriate to characterize the contents. After the contents of the drums/containers have been characterized, arrangements will be made for disposal. The disposal method will be discussed with the DOH and will be implemented after regulatory agency approval.

Soil surrounding the buried tanks or containers will be managed in accordance with 4.1 of this section.

4.4 Underground Storage Tanks

In the event an underground storage tank is encountered during an excavation associated with a construction project, removal of the tank and excavation of any petroleum-contaminated soils in the tank basin will be conducted in accordance with NDDH's Cleanup Action Levels for Gasoline and Other Petroleum Hydrocarbons and Investigation of Contaminant Release Sites. The underground tank will be removed by an underground storage tank contractor or a contractor recommended by the NDDH that will be mobilized to the site.

The storage tank contractor will confirm that the underground storage tank is isolated from all piping and that utilities in the area have been adequately located and marked and that they can be avoided as the tank and any contaminated soil is removed. To the maximum extent practicable, the tank excavation contractor will remove and containerize residual tank contents prior to tank excavation. Appropriately trained personnel will handle all residual tank contents in accordance with NDDH and OSHA requirements. Tank excavation and removal will be completed in a manner that minimizes the potential for spillage of residual tank contents. Temporary onsite storage of the removed tank will be on plastic sheeting (minimum of 10-mil) to prevent incidental soil contamination.

In the event of a visible release of petroleum product or hazardous substances from the tank, assessment and notifications procedures described in Section 3.0 will be implemented and any resulting contaminated soil will be managed in accordance with procedures described in 4.1 of this section.

4.5 Buried Debris Including Asbestos-Containing Waste Materials

Buried debris unexpectedly encountered during an excavation that does not contain asbestos-containing material will be excavated, temporarily stored onsite, and disposed of at the Minot Landfill; no analytical sampling is required for disposal of debris.

Buried debris sometimes contains asbestos-containing material (ACM). The environmental professional that is sent to assess the discovery of buried debris in a contingency situation will be trained in asbestos awareness as required for Class IV asbestos work.

If suspected ACM is identified by the asbestos awareness-trained environmental professional, the material will be sampled by a fully-certified and licensed asbestos inspector to help identify the proper separation,

handling, and disposal of the material. If excavation of ACM is required, a licensed abatement asbestos contractor will be used to provide the proper handling and disposal of the ACM. All asbestos-related work will be conducted in accordance with North Dakota Department of Health (Ch. 33-15-13) and federal National Emission Standards for Hazardous Air Pollutants (NESHAP) requirements. Monitoring of airborne asbestos concentrations will be conducted in accordance with the OSHA, asbestos requirements for the construction industry (29 CFR 1926.1101) An emission control plan will be prepared and implemented for the work if regulated quantities (over 260 lf, 160 sf or 35 cf) of ACM or ACM and soil mixture are encountered during the excavation activities. The ACM contractor will use standard operating procedures during excavation and abatement work to ensure maximum protection and to safeguard workers, visitors, tenants, site employees and the environment.

4.6 Water Accumulation in the Excavation

In the event an excavation must be dewatered during construction activities and procedures describing this dewatering are not contained in the project specifications, the contractor will first contain the water and then notify the construction manager following the notification procedures in Section 2.0 of this Plan). If the water is in contact with potentially-contaminated soil, or displays an odor, sheen, or another indication of contamination, the water will be sampled by an environmental professional and the results of the sampling will be used to design a plan for treating and disposing of the water and acquiring the necessary permits for discharge to an approved facility (sanitary sewer, storm sewer, or other facility).

4.7 Objects Such as Wells or Vent Pipes

In the event a metal vent pipe is uncovered during an excavation, the excavation will be continued to a depth of 10 to 15 feet below the ground surface to determine if the pipe is connected to a tank. If the pipe is not connected to a tank or if the feature appears to be water well, a licensed water well contractor will be mobilized to permanently seal the well in accordance with state, county and local requirements and to file the appropriate paperwork to complete the sealing operation. If the feature is not a well or a potential downward conduit for contamination (e.g., an old piling, etc), it will be cut off at a reasonable depth and the location will be recorded with GPS coordinates.

5.0 Documentation and Reporting

The implementation of the contingent actions will be documented and reported in a Contingent Action Report in accordance with DOH reporting requirements. The Contingent Action Report will include a text description of the contingent work with supporting documentation which may include tables summarizing the results of field screening and analytical sampling (including waste profile samples); figures documenting the location of contingent activities, a photo log, manifests for all waste disposed offsite, field notes, and laboratory analytical reports. The report will be prepared by the environmental professional responsible for implementing the contingent action.

The Contingent Action Report will be submitted to the NDDH upon completion of the project and will provide the NDDH documentation that the contingent actions were completed in accordance with the Site Contingency Plan.

Appendix G

Limitations and Qualifications

Limitations

The detailed history of ownership and land-use to satisfy the requirements and purpose of the Assessment was determined from the activities listed in the report, and a title review was not needed.

The scope of the HTRW did not involve the collection and analysis of any type of sample. The Assessment did not involve completion of any surveys or the offering of any opinions or advice with respect to structural engineering matters, asbestos-containing materials, radon, lead-based paint, lead in drinking water, wetlands, compliance with environmental regulations, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, indoor air quality, biological agents, mold, or other conditions that are beyond the scope of the HTRW guidance.

Barr has performed its work in a manner consistent with the care and skill ordinarily exercised by members of the environmental profession under similar budget and time constraints. Within this context, Barr assumes responsibility for its own observations, along with its interpretation of the information gathered. No other warranty is made or intended.

Because Barr was not retained to verify information, Barr assumes no responsibility for the accuracy of information that it obtained from other sources including, without limitation, regulatory and government agencies, persons interviewed about the Property, and vendors of public data. Performance of the Assessment is intended to reduce, but will not eliminate uncertainty regarding the presence of HTRW conditions within the Assessment Area. To the extent that Barr does not identify HTRW conditions within the Assessment Area, Barr's opinions in the report are not representations that the Property is free of such conditions. Under no circumstances can Barr represent or warrant that releases of hazardous substances or petroleum products do not exist on the Property.
