VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 48' 48.58" N 117° 43' 44.40" W	5. Location Sketch/Notes  Photo taken on 3/24/2011 from the OT Interpretive Center, looking southeast  Photo simulation has been done for this KOP. Figure #: 1B-12
Key Observation Point – KOP 5 – 25a NHOTIC Proposed Route		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Undulating valley with sweeping angular sides and distant background pyramidal silhouettes of mountain peaks	Short low grasses; clumps of short to medium height bushes creating a mottled appearance.	Thin, tall rectangular and angled; weak horizontal bands geometric angular buildings.
LINE	Undulating lines against the background mountain silhouettes, strong horizon lines	Soft, irregular digitate lines along ridges, edges adjacent to man-made development	Vertical, angular, edge lines of road
COLOR	Dark brown, light and dark gray; light tan; white (snow); raw sienna; bluish hues in background due to atmospheric conditions	Brown; grey hues; tans; olives, light green	Dark Brown, light and dark grey, tan and white
TEXTURE	Smooth, uniform and undulating foothills; contrasting, medium to coarse distant mountains (snow appears smooth)	Medium to coarse stippled bushes on undulating slopes and valley, gradational coarse (in foreground) to smooth in background	Smooth, fine surface of road; smooth surfaces of Fence and poles and buildings

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Simple geometric forms created by pad foundation work, cut/fill and access road clearance	Simple geometric forms created by vegetative clearing for pad foundations and access roads	Few short, angular lattice towers in middle ground
LINE	Simple lines and edges created by pad foundation work, cut/fill and access road clearance	Simple lines and edges created by vegetative clearing for pad foundations and access roads	Complex, angular lattice tower; thin, curving, parallel lines of conductors
COLOR	Light tan, sandy	Changes to vegetation not apparent from KOP	Dark grayish blue, light grey, dark grey, metallic, dull chroma
TEXTURE	Smooth clearing	Patchy opening in the vegetation	Contrasting, dotted towers; smooth, metallic finish of structures

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.  DEGREE  OF  CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)
	LAND/WATER BODY (1)				VEGETATION (2)				STRUCTURES (3)				
	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	
													3. Additional mitigating measures recommended? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)
													Evaluator's Names: Kevin McCoy Date: 06/24/2014

	Color			X			X					X	
	Texture			X			X					X	

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The view of the Proposed route lies clearly in the middleground of the VRM Class III area. The distance from the identified “static” KOP is approximately 1.03 miles at its nearest point to project components. Except for the towers that are elevated and skylined to the southeast, the aspect of the project view from this KOP is at a downward angle to near level views as the project transitions to hill slopes for backdrops. Backdrops exist as a result of a variety of terrain ranging from a mottled to solid vegetation of the valley floor to texture, cut hillsides to the north and south. Distance, aspect, vegetation and terrain all help in the reduction of the visual impacts from this project at this KOP. With the scale of the project making the structures visible at a size of 3/16 to ¼ inch on the landscape from the KOP, the visual contrast is further reduced. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 89°. The primary focus of the viewer’s attention within the MG is enclosed to semi-panoramic view of line of travel to the Oregon Trail) from which the project components would be in view. The viewer position would be predominately superior. Although the project will be noticeable to the casual observer, from KOP 5-25a, the project will not dominate the landscape and would be in compliance with VRM III designation.

Reflectivity of the Proposed route would be most intense during mid-afternoon hours for the Proposed route, with backlighting occurring during the morning hours. However, the anticipated impacts from the Proposed route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Proposed route:

- Micro site route to move towers in the area of structure #695 off of the ridge to east to avoid skylining. (sage grouse issues will dictate possibility here)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to a brownish tone (which ever best blends with the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don’t just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The view of the Flagstaff alternative lies clearly in the middleground of the VRM Class III area from this KOP. The distance from the identified “static” KOP ranges from 1.2 miles at its nearest point. The aspect of the project view from this KOP is at a downward angle and backdrops exist as a result of a variety of terrain ranging from a mottled to solid vegetation of the valley floor to texture and hillsides. Distance, aspect, vegetation and terrain all help in the reduction of the visual impacts from this project at this KOP. With the scale of the project making the structures visible at a size of 3/16 to ¼ inch on the landscape from the KOP, the visual contrast is further reduced. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 19°. The primary focus of the viewer’s attention within the MG is scenic view of direction of travel on the Oregon Trail from which the project components would be in view. The viewer position would be predominately superior. Although the project will be noticeable to the casual observer, from KOP 5-25a, the project will not dominate the landscape and would be in compliance with VRM III designation.

Reflectivity of the Flagstaff Alternative would be most intense during late-morning hours, with backlighting occurring during the mid-afternoon hours. However, the anticipated impacts from the Flagstaff Alternative would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative:

- Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The view of the Proposed route lies clearly in the middleground of the VRM Class III area from its skyline entry at the southeast to its departure via topographical drainage to the northeast. The distance from the identified "static" KOP ranges from 1.08 miles at its nearest point. Except for the towers that are elevated and sky lined to the southeast, the aspect of the project view from this KOP is at a downward angle to near level views as the project transitions to hill slopes for backdrops. Backdrops exist as a result of a variety of terrain ranging from a mottled to solid vegetation of the valley floor to texture, cut hillsides to the north and south. Distance, aspect, vegetation and terrain all help in the reduction of the visual impacts from this project at this KOP. With the scale of the project making the structures visible at a size of 3/16 to 1/4 inch on the landscape from the KOP, the visual contrast is further reduced. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 89°. The primary focus of the viewer's attention within the MG is panoramic view of line of travel to the Oregon Trail) from which the project components would be in view. The viewer position would be predominately superior. Although the project will be noticeable to the casual observer, from KOP 5-25b, the project will not dominate the landscape and would be in compliance with VRM III designation.

Reflectivity of the Proposed route would be most intense during mid-afternoon hours for the Proposed route, with backlighting occurring during the morning hours. However, the anticipated impacts from the Proposed route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Proposed route:

- Micro site route to move towers in the area of structure #695 off of the ridge to east to avoid skylining. (sage grouse issues will dictate possibility here)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to a brownish tone (which ever best blends with the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 48' 55.52" N 117° 43' 41.84" W	5. Location Sketch/Notes  Photo taken on 3/24/2011 from the Lode Mine at the Oregon Trail Interpretive Center looking north and southeast.
Key Observation Point – KOP 5 – 25b-3 NHOTIC Proposed compare to Timber Canyon Alternative		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Open valley; gently rolling hills throughout the viewshed with subtle and stark transitions to distant background mountain silhouettes	Short, low-lying grasses and shrubs	Solid, moderate-height rectangular; horizontal curvilinear fence; distant vertical poles
LINE	Flat horizontal lines creating a butt edge against the background mountain silhouettes, undulating lines in the foreground	Hard linear lines along edges of trail; vertical and clumped in foreground becoming softer in middleground	Diagonal, angular, strong divergent lines of structure create a butt edge against soft terrain
COLOR	Dark brown and reds, light and dark grey, light tan, white, blue/grey hues in background due to atmospheric conditions	Brown, blue/grey hues; tans; olives	Black, grey, brown/wood
TEXTURE	Smooth, uniform valley floor and undulating to flat ridgelines	Coarse in immediate foreground that transitions to medium and uniform bushes on undulating slopes of valley	Flat, smooth, even

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Simple geometric forms created by pad foundation work, cut/fill and access road clearance	Simple geometric forms created by vegetative clearing for pad foundations and access roads	At over 1-mile, few short, angular lattice towers in middle ground would be visible
LINE	Simple lines and edges created by pad foundation work, cut/fill and access road clearance	Simple lines and edges created by vegetative clearing for pad foundations and access roads	At over 1-mile, angular lattice towers and thin, curving, parallel lines of conductors may be visible against the terrain.
COLOR	Light tan, sandy	Changes to vegetation not apparent from KOP	At over 1-mile, some dark grayish blue, light gray, dark grey, metallic, dull chroma structures would be visible against the background terrain
TEXTURE	Smooth clearing	Patchy opening in the vegetation	Dotted towers, smooth, metallic finish of structures would be visible in breaks in terrain.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The view of the Proposed route lies clearly in the middleground of the VRM Class III area from its skyline entry at the southeast to its departure via topographical drainage to the northeast. The distance from the identified "static" KOP ranges from 1.08 miles at its nearest point. Except for the towers that are elevated and sky lined to the southeast, the aspect of the project view from this KOP is at a downward angle to near level views as the project transitions to hill slopes for backdrops. Backdrops exist as a result of a variety of terrain ranging from a mottled to solid vegetation of the valley floor to texture, cut hillsides to the north and south. Distance, aspect, vegetation and terrain all help in the reduction of the visual impacts from this project at this KOP. With the scale of the project making the structures visible at a size of 3/16 to 1/4 inch on the landscape from the KOP, the visual contrast is further reduced. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 89°. The primary focus of the viewer's attention within the MG is panoramic view of line of travel to the Oregon Trail) from which the project components would be in view. The viewer position would be predominately superior. Although the project will be noticeable to the casual observer, from KOP 5-25b, the project will not dominate the landscape and would be in compliance with VRM III designation.

Reflectivity of the Proposed route would be most intense during mid-afternoon hours for the Proposed route, with backlighting occurring during the morning hours. However, the anticipated impacts from the Proposed route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Proposed route:

- Micro site route to move towers in the area of structure #695 off of the ridge to east to avoid skylining. (sage grouse issues will dictate possibility here)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to a brownish tone (which ever best blends with the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The Flagstaff alternative does not occupy BLM managed public lands, but is clearly noticeable from the interpretive center in the foreground and middleground and is analyzed here due to the sensitivity and national significance of the area and can be seen from 5-25c as the line travels from south to north.

The Flagstaff segment that is visible to visitors of the National Historic Oregon Trail Interpretive Center at a range of 1.2 miles from the center itself, and approximately .44 miles from the KOP. Additionally, the travelers westbound on US-86 will begin viewing this alternative at approximately .50 miles with a downward aspect and significant agricultural backdrops created on the valley floor. Timeframes of visibility will be approximately 45-60 seconds at 55mph until passing directly under the lines where the transmission line crosses the highway. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 126°. The primary focus of the viewer's attention is close proximity landscape views of Oregon Trail direction of travel from which the project components would be in view. The viewer position would be predominately superior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 10°. The primary focus of the viewer's attention within the MG is close proximity landscape views of Oregon Trail direction of travel) from which the project components would be in view. The viewer position would be predominately superior.

Reflectivity of the Flagstaff alternative would be most intense during mid-morning hours with alternate backlighting occurring for each segment during mid/late afternoon. Although the Flagstaff alternative does not exist on BLM managed lands, the visual impacts analysis from this segment would begin to violate the VRM III determination for the nationally significant area that exists on the BLM lands. Therefore, the Flagstaff alternative as seen from this KOP would begin to violate compliance with the VRM objects for the area as a result of the outside influence of the project implementation.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The Proposed route occupies BLM managed public lands and is clearly noticeable from the interpretive center in the middleground and is analyzed here due to the sensitivity and national significance of the area from 5-25c.

The Proposed segment that is visible to visitors of the National Historic Oregon Trail Interpretive Center at a range of 3.29 miles from the KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. The primary focus of the viewer's attention is close proximity landscape views of Oregon Trail direction of travel from which the project components would not be in view. The viewer position would be predominately neutral. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 4°. The primary focus of the viewer's attention within the MG is close proximity landscape views of Oregon Trail direction of travel from which the project components would be in view. The viewer position would be predominately neutral.

Reflectivity of the Proposed route would be most intense during mid-morning hours with alternate backlighting occurring for each segment during mid/late afternoon. The Proposed route through the visual impacts analysis from this segment would not violate the VRM III determination for the nationally significant area that exists on the BLM lands. Therefore, the Proposed route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 48' 50.79" N 117° 43' 46.29" W	5. Location Sketch/Notes  Photo taken on 3/24/2011 from KOP 5-55-e near the NHOTIC amphitheater adjacent to the Flagstaff Hill Trail and approximately 400 feet south of the main building. The view orientation at the site is toward the northwest and west  Photo simulation has been created for this KOP. See figure # 1B-19
Key Observation Point – KOP 5-25e NHOTIC Compared to Flagstaff Alternative		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Undulating valley with sweeping angular sides and distant background pyramidal silhouettes of mountain peaks (snow creates simple geometric forms)	Short low grasses; clumps of short to medium height interspersed bushes creating a mottled appearance	Rectangular and angled; horizontal and curving bands geometric angular buildings
LINE	Undulating lines against the background mountain silhouettes, strong horizon lines.	Soft, irregular digitate lines along ridges, edges adjacent to man-made development create strong butt edges	Vertical, angular, geometric, edge lines of roads and paths are strong
COLOR	Dark brown, light and dark grey; light tan; white (snow); raw sienna; bluish and violet hues in back ground due to atmospheric conditions.	Brown; grey hues; tans; olives, light green	Dark brown, light and dark grey, tan beige and white
TEXTURE	Smooth, uniform and undulating foothills; contrasting, medium to coarse distant mountains (snow appears rough and stippled)	Medium to coarse stippled bushes on undulating slopes and valley, gradational course (in foreground) to smooth in middle and background.	Smooth, fine surface of road and path; smooth surfaces of buildings.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Possible weak simple geometric forms created by pad foundation work, cut/fill	Changes to vegetation not apparent	Few short, angular lattice towers in middle ground
LINE	Possible simple lines and edges created by pad foundation work, cut/fill	Changes to vegetation not apparent	Complex, angular lattice towers; thin, curving, parallel lines of conductors
COLOR	Light tan, sandy, grey	Changes to vegetation not apparent	Dark greyish blue, light grey, dark grey, metallic, dull chroma
TEXTURE	Smooth clearings	Changes to vegetation not apparent	Contrasting, dotted towers; smooth, metallic finish of structures

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The Flagstaff alternative does not occupy BLM managed public lands, but is clearly noticeable from the interpretive center in the foreground and is analyzed here due to the sensitivity and national significance of the area and can be seen from 5-25c as the line travels from south to north.

The Flagstaff segment that is visible to visitors of the National Historic Oregon Trail Interpretive Center at a range of 1.18 miles from the center itself, and between .30-.50 miles from the closest foot trail sections. Additionally, the travelers westbound on US-86 will begin viewing this alternative at approximately .50 miles with a downward aspect and significant agricultural backdrops created on the valley floor. Timeframes of visibility will be approximately 45-60 seconds at 55mph until passing directly under the lines where the transmission line crosses the highway. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 75°. The primary focus of the viewer's attention within the MG is close proximity landscape views of Oregon Trail direction of travel from which the project components would be in view. The viewer position would be predominately superior.

Reflectivity of the Flagstaff alternative would be most intense during mid-morning hours with alternate backlighting occurring for each segment during mid/late afternoon. Although the Flagstaff alternative does not exist on BLM managed lands, the visual impacts analysis from this segment would not violate the VRM III determination for the nationally significant area that exists on the BLM lands. Therefore, the Flagstaff alternative would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The Proposed route that is visible to visitors of the National Historic Oregon Trail Interpretive Center from this KOP at a range of 1.06 miles. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 111°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral.

Reflectivity of the Proposed route would be most intense during mid-afternoon hours with alternate backlighting occurring for each segment during mid/late morning. The Proposed route and through the visual impacts analysis from this segment would be directly visible to the casual observer and become a focal point on the landscape but would not violate the VRM III determination for the nationally significant area that exists on the BLM lands. Therefore, the Propose route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI III viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

The Burnt River Alternative of the project is viewed from the Hill Creek road area in association with a component of the Oregon Trail. The project is seen at a distance of .77 miles from the static point with varied textured terrain as a backdrop and a consistent foreground influence from the interstate as well as US 30 in the form of road cuts, fills, guardrails and concrete dividers. The scale of the project is extremely small at that distance with structures ranging in size from 3/16 to 1/8 inches when in view. However, with the surrounding terrain, the structures are readily absorbed into the landscape from the static KOP. Travelling visibility in this general location would be on I-84 with a moving view of 1.7 miles, or a view of the project alternative for approximately 70-75 seconds. However, views of the project from this KOP are very limited for BLM ownerships with the primary project views seen on private lands. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 20°. The primary focus of the viewer’s attention is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 94°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior.

Overall contrast would be weak to none from the static KOP location as well to linear progression by visitors.

Additional Mitigating Measures (See item 3)

No additional mitigations are identified from this KOP.

The scale of the project is extremely small at that distance with structures ranging in size from 3/16 to 1/8 inches when in view. However, with the surrounding terrain, the structures are readily absorbed into the landscape from the static KOP. Travelling visibility in this general location would be on I-84 with a moving view of 1.7 miles, or a view of the project alternative for approximately 70-75 seconds. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 14°. The primary focus of the viewer’s attention is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 86°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral.

Overall contrast would be weak to none from the static KOP location as well to linear progression by visitors.

Additional Mitigating Measures (See item 3)

No additional mitigations are identified from this KOP.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 48' 39.40" 117° 44' 36.79"	5. Location Sketch/Notes  Photo taken on 3/24/2011 near the Kiwanis Club Oregon Trail Memorial along SH 86 adjacent to the OT Interpretive Center, looking north.  No photo simulation was done for this KOP.
Key Observation Point – KOP 5 – 32 Kiwanis Club Memorial Flagstaff Alternative		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

1. LAND/WATER		2. VEGETATION		3. STRUCTURES	
FORM	Wide, stream valley with flat bottom and undulating to steep angular sides creating distant background silhouettes	Short low grasses; clumps of short to medium height bushes creating a mottled appearance		Thin, moderate height rectangular; horizontal curvilinear bands	
LINE	Flat horizontal lines of the valley creating a butt edge against the background mountain silhouettes, undulation lines in the foreground	Soft, irregular digitate lines along ridges		Vertical, angular, strong divergent lines of road create a butt edge	
COLOR	Dark brown, light and dark grey; light tan; white; raw sienna; bluish hues in background due to atmospheric conditions	Brown grey hues tans olive		Dark brown, light and dark grey; dark bluish grey, green	
TEXTURE	Smooth, uniform valley bottom and undulating foothills; contrasting, medium to coarse distant mountains.	Fine grasses in valley bottom, medium to coarse stipple bushes on undulating slopes of valley		Smooth, fine surface of road; smooth surfaces of fence and poles	

SECTION C. PROPOSED ACTIVITY DESCRIPTION

1. LAND/WATER		2. VEGETATION		3. STRUCTURES	
FORM	Changes not visible from KOP	Changes to vegetation not visible from KOP; Possible simple geometric forms created by vegetative clearing for tower pads and access roads		Few short, angular lattice towers in the foreground to middle ground of the Flagstaff Alternative	
LINE	Changes not visible from KOP	Changes to vegetation not visible from KOP; Possible simple lines and edges created by vegetative clearing for tower pads and access roads		Complex, angular lattice towers; thin, curving, parallel sweeping lines of conductors	
COLOR	Changes not visible from KOP	Changes not visible from KOP		Dark greyish blue, light grey, dark grey, flat metallic (dull chroma)	
TEXTURE	No proposed changes to land/water	Changes not visible from KOP		Contrasting, dotted towers; smooth, metallic finish of structures

	Line			X					X			X	
	Color			X					X		X		
	Texture				X				X			X	

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system to the VRM III classification. The area of this memorial falls within that expanded VRM III area.

Visibility of the Flagstaff alternative from this KOP is minimal. However one tower is clearly seen in the funneled view to the west of the site and is noticeable to the casual observer from this KOP in the middleground (.54 mile). Although the towers placement is on private lands, due to the sensitivity and importance of the NHOTIC, it impacts to the views from the memorial are being analyzed.

The view of the Flagstaff alternative lies clearly in the foreground of the VRM Class III area but is seen from an elevated view as its alignment is seated at the edge of the Baker Valley floor and runs from south to north. The distance from the identified KOP is approximately .54 mile at a downward angle which brings details of the structure clearly into the viewer perspective. Backdrops exist as a result of a variety of terrain and vegetation of the valley floor ranging from a mottled to solid vegetation texture, fence lines, geometric shapes from structures and agricultural practices, ditch lines and riparian borders. Distance, aspect, vegetation, terrain and minimal visibility aid in the reduction of the visual contrasts from this project at this KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 67°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral. The funneled view from the memorial towards the direction of travel of early pioneers would direct the eyes of the viewer towards the visible structure which would attract the attention of the casual observer. However, the components of the project visible do not dominate the viewshed and therefore would be in compliance with VRM III designation.

Timeframes of visibility will be static for approximately 10-15 minutes as visitors examine the memorial. Reflectivity of the site would be most intense during mid-morning hours. Scale of the project would be approximately ½ inch for structures seen at the distance of the KOP.

Additional Mitigating Measures (See item 3)

*Although no component of this alternative exists on BLM lands in this area, due to the sensitivity of the surrounding area as a result of the National Historic Oregon Trail Interpretive Center/Oregon Trail ACEC, the following additional mitigations are recommendations only.*

Flagstaff Alternative:

- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Relocate tower #8 either north or south to take it out of the funneled view.
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or use galvanized metal stain to create a brownish tone to the towers
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system to the VRM III classification. The area of this memorial falls within that expanded VRM III area.

Visibility of the Proposed route from this KOP occurs and is noticeable to the casual observer from the middleground (1.57 mile).

The view of the Proposed route lies clearly in the middleground of the VRM Class III area. The distance from the identified KOP is approximately 1.57 mile at an upward angle which brings details of the structure clearly into the viewer perspective. Backdrops exist as a result of a variety of terrain and mottled to solid vegetation texture, fence lines. Distance, aspect, vegetation, terrain and minimal visibility aid in the reduction of the visual contrasts from this project at this KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 150°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. The components of the project visible do not dominate the viewshed and therefore would be in compliance with VRM III designation.

Timeframes of visibility will be static for approximately 10-15 minutes as visitors examine the memorial. Reflectivity of the site would be most intense during mid-morning hours. Scale of the project would be approximately ½ inch for structures seen at the distance of the KOP.

Additional Mitigating Measures (See item 3)

Proposed route:

- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Minimize skylining by tower relocation.
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or use galvanized metal stain to create a brownish tone to the towers
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system to the VRM III classification. The area of this access point to the western ruts from the interpretive center falls within that expanded VRM III area.

The view of the Proposed route lies clearly in the middleground of the VRM Class III area but is seen from a level to elevated view as its current alignment is situated as a skylined view towards tower #695 & #694 to a valley floor view with terrain backdrop for the remainder of the line until its slightly skylined departure between tower #685 - #687 to the northern view. The distance from the identified KOP is approximately .96 miles. Backdrops exist as a result of a variety of terrain and vegetation components for the segment of the line crossing the valley floor which is a funneled panoramic view. Distance, aspect, vegetation and terrain help with the reduction of the visual impacts from this project at this KOP except for those structures that break the skyline. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 86°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. Additionally, the access point off of the highway focuses the use and views to the ruts situated north and west from this KOP and therefore away from the Proposed route.

Timeframes of visibility will be static from this KOP for approximately 10-15 minutes as visitors examine the interpretive signing, or proceed from the KOP to hike the trail ruts area. Reflectivity of the site would be most intense during afternoon hours Scale of the project would not conform to the natural features of the area as the tower structures would appear as approximately ¼-3/16 inches in height on the landscape.

All of these factors indicate that the project would attract the attention of the casual observer and could begin to become a focal point that alters the landscape.

Additional Mitigating Measures (See item 3)

Proposed route:

- Micro site route to move skylined towers in the area of tower #695 off of the ridge to east to avoid skylining. (sage grouse issues will dictate possibility here)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to a brownish tone (which ever best blends with the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don’t just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system to the VRM III classification. The area of this access point to the western ruts from the interpretive center falls within that expanded VRM III area.

Visibility of the Flagstaff alternative lies clearly in the middleground of the VRM Class III in a valley floor view with terrain backdrop at a distance from the identified KOP of 1.14 miles. Backdrops exist as a result of a variety of terrain and vegetation components for the segment of the line crossing the valley floor. Distance, aspect, vegetation and terrain help with the reduction of the visual impacts from this project at this KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 38°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately superior. Additionally, the access point off of the highway focuses the use and views to the ruts situated north and west from this KOP and therefore away from the route.

Timeframes of visibility will be static from this KOP for approximately 10-15 minutes as visitors examine the interpretive signing, or proceed from the KOP to hike the trail ruts area. Reflectivity of the site would be most intense during afternoon and morning hours and the scale of the project would not conform to the natural features of the area as the tower structures would appear as approximately ¼-3/16 inches in height on the landscape.

All of these factors indicate that the project would attract the attention of the casual observer but would not violate the management objectives for the VRM III designation.

Additional Mitigating Measures (See item 3)

Flagstaff Alternative:

- Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location 44° 48' 31.66" N 117° 43' 54.60" W	5. Location Sketch/Notes Photo taken on 3/24/2011 from the Oregon Trail along SH 86 adjacent to the OT Interpretive Center, looking East.  No Photo Simulation was done for this KOP.
Key Observation Point – KOP 5 – 33-3 Hwy 86 Oregon Trail Ruts Access site Proposed compare to Timber Canyon Alternative		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Undulating valley with angular sides creating distant background silhouettes of pyramidal peaks	Short low grasses; clumps of short to medium height bushes, creating a mottled appearance	Thin, tall rectangular and angled; horizontal curvilinear bands
LINE	Flat horizontal to undulating lines against the background mountain silhouettes, sweeping lines frame background	Soft, irregular digitate lines along ridges, edges adjacent to man-made development	Vertical, angular strong horizontal convergent lines of road create a butt edge
COLOR	Dark brown, light and dark grey; light tan; white (snow); raw sienna; bluish hues in background due to atmospheric conditions	Brown; grey hues; tans; olives, light highland green	Dark brown, light and dark grey
TEXTURE	Smooth, uniform and undulating foothills; contrasting, medium to coarse distant mountain (snow appears smooth)	Medium to coarse stippled bushes on undulating slopes and valley, gradational coarse (in foreground) to smooth in background	Smooth, fine surface of road; smooth surfaces of fence and poles.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes not visible from KOP	Changes to vegetation not apparent from KOP	Potentially a few short, angular lattice towers visible in foreground against the skyline
LINE	Changes not visible from KOP	Changes to vegetation not apparent from KOP	Complex, angular lattice towers; thin, curving, parallel lines of conductors partially visible
COLOR	Changes not visible from KOP	Changes to vegetation not apparent from KOP	Dark greyish blue, light grey, dark grey, metallic, dull chroma
TEXTURE	Changes not visible from KOP	Changes to vegetation not apparent from KOP	Contrasting, dotted towers; smooth, metallic finish of structures

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system to the VRM III classification. The area of this access point to the western ruts from the interpretive center falls within that expanded VRM III area.

The view of the Proposed route lies clearly in the middleground of the VRM Class III area but is seen from a level to elevated view as its current alignment is situated as a skylined view towards tower #695 & #694 to a valley floor view with terrain backdrop for the remainder of the line until its slightly skylined departure between tower #685 - #687 to the northern view. The distance from the identified KOP is approximately .96 miles. Backdrops exist as a result of a variety of terrain and vegetation components for the segment of the line crossing the valley floor which is a funneled panoramic view. Distance, aspect, vegetation and terrain help with the reduction of the visual impacts from this project at this KOP except for those structures that break the skyline. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 86°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. Additionally, the access point off of the highway focuses the use and views to the ruts situated north and west from this KOP and therefore away from the Proposed route.

Timeframes of visibility will be static from this KOP for approximately 10-15 minutes as visitors examine the interpretive signing, or proceed from the KOP to hike the trail ruts area. Reflectivity of the site would be most intense during afternoon hours Scale of the project would not conform to the natural features of the area as the tower structures would appear as approximately ¼-3/16 inches in height on the landscape.

All of these factors indicate that the project would attract the attention of the casual observer and could begin to become a focal point that alters the landscape.

Additional Mitigating Measures (See item 3)

Proposed route:

- Micro site route to move skylined towers in the area of tower #695 off of the ridge to east to avoid skylining. (sage grouse issues will dictate possibility here)
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to a brownish tone (which ever best blends with the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don’t just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 54' 28.98" N 117° 42' 1.0434" W	5. Location Sketch/Notes  Photo was taken on 9/15/2011 from Mitchell Butte road looking south and west  No photo simulation was done for this KOP.
Key Observation Point - KOP 5 - 34 Powder River ACEC Proposed Route		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Flat valley foreground, gently rolling terrain in middle ground and background	Short, low-lying grasses and shrubs/sagebrush	Primitive two track road
LINE	Gently curving, ridgelines against sky	Scattered vegetation has no discernible line or pattern	Linear edges of gravel road against surrounding vegetation
COLOR	Land covered by golden grasses; green, blue/grey sagebrush	Golden grasses, green, blue/grey sagebrush; reds and browns in middleground and background	Browns from exposed soils
TEXTURE	Fine textured slopes with subtle contrast to smooth sky and fin-grained vegetation	Expanses of low-lying grasses and random shrubs in the foreground; smooth carpet of sage on distant ridges	Medium road surface

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Potential changes to land/water not visible from KOP due to existing intervening terrain and distance of over 3 miles	Potential changes to vegetation not visible from KOP due to existing intervening terrain and distance of over 3 miles	Possible visibility of a few, short angular towers in background contrasting against skyline
LINE	Potential changes to land/water not visible from KOP due to existing intervening terrain and distance of over 3 miles	Potential changes to vegetation not visible from KOP due to existing intervening terrain and distance of over 3 miles	Possible vertical lines from transmission towers; if visible, lines would be faint but contrast against background terrain or skyline.
COLOR	Potential changes to land/water not visible from KOP due to existing intervening terrain and distance of over 3 miles	Potential changes to vegetation not visible from KOP due to existing intervening terrain and distance of over 3 miles	Towers may appear as dark lines against the light sky
TEXTURE	Potential changes to land/water not visible from KOP due to existing intervening terrain and distance of over 3 miles	Potential changes to vegetation not visible from KOP due to existing intervening terrain and distance of over 3 miles	Potential for dotted towers to be visible. If visible, these would be partially absorbed by the existing dotted textures in the landscape.

**SECTIOND. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III for visual objectives. Since the Powder River ACEC also contains the Powder Wild and Scenic River component, portions of that Wild and Scenic administrative boundary views can be seen within the viewshed from this KOP and are classified as VRM II. However, the project does not impact the visual resources of these lands.

The Proposed Route is visible from this KOP. The views of the Proposed route lies clearly in the middle ground (approximately 4.01 miles at its nearest point) where the view of the project at that distance makes it unperceivable on the landscape by the casual observer, especially with the backdrops that exist in the form of surrounding hillsides and panoramic views. Distance, scale, aspect, vegetation and terrain all play a part in the elimination of the visual impacts from these alternatives for this project at this KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 21°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral.

Timeframes of visibility will be variable from this KOP for some users as most use in this area is of one travelling form or another ranging from foot/equestrian to motorized with minimal visual visibility (<5minutes). Reflectivity of the site would be most intense during morning for the Proposed route.

All of these factors indicate that the project should not attract the attention of the casual observer and would be in compliance with VRM III designation as well as the VRM II designation of the Wild and Scenic River.

Additional Mitigating Measures (See item 3)

None.

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI III viewshed. However the current RMP direction lists the area as a VRM IV for visual objectives. Since the Propose route is the only visible route from this KOP and exists on private lands, the impacts to the visual component of the Snake River/Mormon Basin Backcountry Byway are beyond BLM influence. Regardless, since the route is a Nationally designated backcountry byway, the BLM felt it requires an assessment of the route along with the views the do exist from BLM lands should be address and reflected in the contrast rating above.

The Proposed Route is the only route visible from this KOP. The views of the Proposed route lies clearly in the foreground (approximately 1.7 miles) at its nearest point to BLM lands and is within a linear travel line of site for approximately 1.87 miles until passing under the proposed line. Views of the project vary from a distant view of the transmission line only, to a more skylined view of two towers (#849 & #850) as you approach the area of the KOP. Backdrops over the travel distance from the BLM lands that lie west of the project line are in the form of surrounding hillsides and focused canyon views which are always in the foreground. Distance, scale, aspect, vegetation and terrain all play a part in the reduction of visual impacts from this proposed route. The KOP #5-44 lies approximately .25 miles from the line with an upward aspect and skylined views with extreme contrast due to the high level of detail visible at this distance. All views are witnessed while travelling the county road for times that range from less than 30 seconds (while travelling west) to no more than 4 minutes of increasing contrast for those viewers travelling east.

Reflectivity of the project would be most noticeable during the late morning to early afternoon hours. Scale of the project from the KOP is dramatically out of conformance with surrounding features, but is less noticeable from the BLM lands where the project would appear at a size that ranges from 3/16 – 1/8 inches on the landscape.

Overall, the project should not attract the attention of the casual observer and would be in compliance with VRM IV designations for the area, as well as meeting the management directions for the SR/MB Backcountry Byway.

Additional Mitigating Measures (See item 3)

None.

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

1989 Baker RMP and the Visual Resource Inventory (2009) list the KOP area as a VRM II/VRI II respectively, the projects location from this viewpoint is situated within a VRM IV designation and a 2009 VRI III classification. Due to the height and placement of this KOP, the Proposed route through Baker county can be seen to varying degrees on the landscape and across both private and BLM land ownerships.

The Proposed Route is visible from this KOP with views of this route lying in both the extreme middle ground of approximately 3.49 to 4.87 miles at its nearest point for the Proposed route. Views of the project are extremely small to unperceivable at the varying distances. Backdrops over the panoramic views from the KOP which when coupled with the distance, scale, aspect, vegetation and terrain, all play a part in the reduction to elimination of visual impacts from this proposed route. All views from this KOP are from the western boundary feature of an area inventoried for Wilderness Characteristics (# OR-035-016) which comprises a primitive road. Visitors to the area would not likely stop at the area of the KOP and would more commonly view the landscape while travelling. Although linear views of the various alternatives are significant for duration while travelling this primitive road, the downward view with highly textured terrain (vegetation, color, geology, etc.) dissolves the project into the landscape both with the natural as well as the manmade features.

Overall, the project should not attract the attention of the casual observer and would be in compliance with VRM.

Additional Mitigating Measures (See item 3)

None.

VISUAL CONTRAST RATING WORKSHEET

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 28' 53.07" N 117° 16' 40.43" W	5. Location Sketch/Notes  Two track road northeast of Lime and approximately 3.34 miles east of I-84. Burnt River Alternative is located 6.17 miles west of KOP.  No photo simulation was created for this KOP.
Key Observation Point – KOP 5-58-2 Lands with wilderness character inventory unit Burnt River Alternative		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Rolling, rounded forms in the foreground and middle ground. Moderate to steep sloped mountains in the back ground	Large patches of sagebrush	Definite, rounded and solid
LINE	Diffused edge between the foreground and the middle ground	Diffused edge of vegetation in the foreground	Band created by graveled roads
COLOR	Dark to medium tans and browns, greens and olives, and grey/purple hues from the mountains	Dark to medium tans and browns, greyish blues, greens and olives	Bright white and silvers. Brown
TEXTURE	Smooth and fine	Medium texture and density sagebrush in the foreground giving way to smooth texture in the middle ground and back ground	Smooth random

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Indistinct due to road upgrades. No change in middleground and background due to long view distance	No change in the middle ground and background due to the long view distance and the contouring of the road would be minor.	Edges of roads to be upgraded. Weak contrast of towers against the back of the mountains due to distance
LINE	Weak line along road for upgrades. No change in middle ground and background due to long view distance	No change in the middle ground and background due to the long view distance and the contouring of the road would be minor.	Straight angular lines of structures and curving lines of conductors
COLOR	No change due to long viewing distance	No change in the middle ground and background due to the long view distance and the contouring of the road would be minor.	Dark to light grey
TEXTURE	No change due to long viewing distance	No change in the middle ground and background due to the long view distance and the contouring of the road would be minor.	Contrast of arrangements of geometric structure.

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.  DEGREE  OF  CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)

	Color				X				X					X
	Texture				X				X					X

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

1989 Baker RMP and the Visual Resource Inventory (2009) list the KOP area as a VRM II/VRI II respectively, the projects location from this viewpoint is situated within a VRM IV designation and a 2009 VRI III classification. Due to the height and placement of this KOP, the Burnt River alternative that goes through Baker county can be seen to varying degrees on the landscape and across both private and BLM land ownerships.

The Burnt River alternative is visible from this KOP with views lying in both the back ground at distances of 6.17 miles to the extreme background of approximately 16.0 +/- miles. Views of the project are extremely small to unperceivable at the varying distances. Backdrops over the panoramic views from the KOP which when coupled with the distance, scale, aspect, vegetation and terrain, all play a part in the reduction to elimination of visual impacts from this proposed route. All views from this KOP are from the western boundary feature of an area inventoried for wilderness characteristics (# OR-035-016) which comprises a primitive road. Visitors to the area would not likely stop at the area of the KOP and would more commonly view the landscape while travelling. Although linear views of the various alternatives are significant for duration while travelling this primitive road, the downward view with highly textured terrain (vegetation, color, geology, etc.) dissolves the project into the landscape both with the natural as well as the manmade features.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

1989 Baker RMP and the Visual Resource Inventory (2009) list the KOP area as a VRM II/VRI II respectively, the projects location from this viewpoint is situated within a VRM IV designation and a 2009 VRI III classification. Due to the height and placement of this KOP, 3 of the routes/alternatives identified to go through Baker county can be seen to varying degrees on the landscape and across both private and BLM land ownerships. Due to this rather large view from the KOP, the assessment here encompasses the visible routes rather than individual segments.

The Proposed Route is visible from this KOP with views in both the foreground at a range of approximately 4.25 miles at its nearest point. Views of the project are extremely small to unperceivable at the varying distances. Backdrops over the panoramic views from the KOP which when coupled with the distance, scale, aspect, vegetation and terrain all aiding in the reduction to elimination of visual impacts from this proposed route. All views from this KOP are from the western boundary feature of an area inventoried for wilderness characteristics (# OR-035-016) which comprises a primitive road. Visitors to the area would not likely stop at the area of the KOP and would more commonly view the landscape while travelling although some extended viewing time would be associated with local ranching activities in the immediate area. Although linear views of this route is visible while travelling this primitive road, the downward view with highly textured terrain (vegetation, color, geology, etc.) as well as the parallel viewing aspect and northerly direction of focus during travel at speeds of approximately 35 mph, dissolves the project into the landscape both with the natural as well as the manmade features. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 58°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately superior.

Additional Mitigating Measures (See item 3)

**SECTIOND. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand the VRM III classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

Visibility of the proposed route is moderate from this KOP. The Proposed route is clearly noticeable in the immediate foreground with the closest tower being approximately .97 miles away. The view of the Proposed route falls within the VRM Class III area with the primary contrast being created by the skylined towers on the north site of US 86 which have limited backdrops to lessen impacts. The distance from the identified KOP to the nearest tower of .97 miles begins to show the details of the lattice structures from the static KOP location with an ever increasing degree as travelers of the highway progress westward until passing beneath the line in 1.35 miles. The upward view of the line with little to no backdrops further increased this contrast as the line diverges from the direction of travel at a near 45 degree angle. The visibility of the lattice features however, are situated to the northern edge of a panoramic landscape where the viewer focal point as well as travelers of the highway, is directed towards the mountainous terrain of the Elkhorn Mountains in the middle ground. These significant backdrop landscape components reduces the contrast of portions of the Proposed route that lies south of the highway significantly. Although the northern structures area still situated in the foreground and are skylined for certain section, they are within a panoramic landscape and do not dominate the overall landscape features from this KOP. Due to the linear nature of the primary viewers of the area, the view of the project would occur over the course of 1.35 miles from east to west travelers, and would only be in view for approximately 1.5 minutes or until travelling beneath the transmission line.

Distance and scale of the project are noticeable to the casual observer with the projects appearing as being ¼” inch in size on the landscape which is out of conformance with other features. However, their presence does not dominate the overall viewshed. Reflectivity of the project would occur in early to mid-morning hours.

While its influence in the VRM III area is noticeable and significant, the time for which the project is in view reduces the overall contrast from this KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the National Historic Oregon Trail Interpretive Center/Oregon Trail ACEC, the following additional mitigations are requested.

Proposed route:

- Micro site route to move towers north of Hwy 86 lower on the landscape or reduce tower height to reduce skylining.
- Micro site route to move valley floor towers farther to the east to reduce overall time project is viewed .
- Reduce tower height if possible to incorporate more backdrop features
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to create brownish colors (whichever is more absorbed by the landscape at this distance).
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives which was modified to expand the VRM III classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

Visibility of the proposed route is moderate from this KOP. The Proposed route is clearly noticeable in the immediate foreground with the closest tower being approximately .97 miles away. The view of the Proposed route falls within the VRM Class III area with the primary contrast being created by the skylined towers on the north site of US 86 which have limited backdrops to lessen impacts. The distance from the identified KOP to the nearest tower of .97 miles begins to show the details of the lattice structures from the static KOP location with an ever increasing degree as travelers of the highway progress westward until passing beneath the line in 1.35 miles. The upward view of the line with little to no backdrops further increased this contrast as the line diverges from the direction of travel at a near 45 degree angle. The visibility of the lattice features however, are situated to the northern edge of a panoramic landscape where the viewer focal point as well as travelers of the highway, is directed towards the mountainous terrain of the Elkhorn Mountains in the middle ground. These significant backdrop landscape components reduces the contrast of portions of the Proposed route that lies south of the highway significantly. Although the northern structures area still situated in the foreground and are skylined for certain section, they are within a panoramic landscape and do not dominate the overall landscape features from this KOP. Due to the linear nature of the primary viewers of the area, the view of the project would occur over the course of 1.35 miles from east to west travelers, and would only be in view for approximately 1.5 minutes or until travelling beneath the transmission line.

Distance and scale of the project are noticeable to the casual observer with the projects appearing as being ¼” inch in size on the landscape which is out of conformance with other features. However, their presence does not dominate the overall viewshed. Reflectivity of the project would occur in early to mid-morning hours.

While its influence in the VRM III area is noticeable and significant, the time for which the project is in view reduces the overall contrast from this KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the National Historic Oregon Trail Interpretive Center/Oregon Trail ACEC, the following additional mitigations are requested.

Proposed route:

- Micro site route to move towers north of Hwy 86 lower on the landscape or reduce tower height to reduce skylining.
- Micro site route to move valley floor towers farther to the east to reduce overall time project is viewed .
- Reduce tower height if possible to incorporate more backdrop features
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to create brownish colors (whichever is more absorbed by the landscape at this distance).
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 80' 89.29" N 117° 67' 93.77" W	5. Location Sketch/Notes  Photo was taken on 2/3/2012 from Highway 86 looking west.  No photo simulation done for this KOP.
Key Observation Point – KOP 5-61-3 Hwy 86 (east of NHOTIC) Proposed Compare to Timber Canyon Alternative		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Wide, open gently rolling hills	Lush carpet of sage brush surrounded by low lying grasses in foreground, middle ground and back ground	Flat road; thing road signs; crossed fence post
LINE	Undulating, horizontal ridgelines against sky	Short, vertical grasses and sagebrush; hard vegetation line against highway 86	Hard line of road creating a butt edge against adjacent grasses; vertical fence posts
COLOR	Light browns and tans; blue grey hues	Golden yellow grasses; dull browns, greys and blues	Dark grey; brown black; white
TEXTURE	Smooth, gently curving terrain	Fine, smooth carpet of low lying grasses; patchy, dotted sagebrush in foreground; fine to medium, dense carpet of sage in the middle ground and back ground	Smooth and fine paved road

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes to land/water not likely visible from KOP.	Changes not likely visible from KOP.	Several lattice towers would be visible on the middle ground landscape. Many towers would be wholly or partly absorbed by background terrain
LINE	Changes to land/water not likely visible from KOP.	Changes not likely visible from KOP.	Bold, straight, angular lines of lattice construction; thin, parallel, curvilinear lines of conductors
COLOR	Changes to land/water not likely visible from KOP.	Changes not likely visible from KOP.	Dark and light greyish blue hues; dark grey, black
TEXTURE	Changes to land/water not likely visible from KOP.	Changes not likely visible from KOP.	Rough, contrasting arrangement of lattice structures and substation equipment; smooth, uniform, metallic finish of lattice towers.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives.

The Proposed Route and the Flagstaff alternative are the only routes visible from this KOP. The views of both routes exist within the middle ground at approximately 5.7 miles at its nearest point for the Flagstaff route. Both alternatives exist primarily on private lands through this viewshed with only a small visible portion of the Proposed route crossing BLM lands in the Magpie peak area at a distance of 10.3 miles. The elevated views from this KOP towards both project routes are unperceivable on the landscape at these distances with the backdrops that exist in the form of surrounding hillsides and panoramic views eliminating the contrast. Distance, scale, aspect, vegetation and terrain all play a part in the elimination of the visual impacts. All of these factors indicate that the project should not attract the attention of the casual observer and would be in compliance with VRM III/IV designation.

Reflectivity of the site would be most likely to occur during late afternoon but would be negligible at the project distances.

Additional Mitigating Measures (See item 3)

None

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives.

The Flagstaff alternative is visible from this KOP with views existing within the extreme foreground to middle ground at approximately 3.02 miles at its nearest point. This alternative exists primarily on private lands through this viewshed. The views from this KOP towards this alternative are relatively level but slight to unperceivable on the landscape at these distances. The scale of the project would be approximately 1/8 to 1/16 in height when viewed from the KOP. Primary viewers would be travelers on I-84 with the project paralleling the line of travel at a consistent distance of between 2.4 – 3.0 miles with project views being seen for approximately 3 minutes. However, the views of the project would be parallel to the line of travel and would not be within the main focal point of the travelers. In fact, the dramatic views of the Elkhorn Mountain range to the west would draw attention away from the landscape and project to the east. The landscape backdrops that exist in the form of surrounding hillsides and limited panoramic views in conjunction with distance, scale, aspect, vegetation and terrain all play a part in the elimination of the visual impacts. Reflectivity of the site would be most likely to occur during mid to late afternoon hours.

All of these factors indicate that the project should not attract the attention of the casual observer and would be in compliance with VRM III/IV designation.

Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 86' 14.36" N 117° 76' 33.11" W	5. Location Sketch/Notes  Photo was taken on 2/3/2012 from Highway 203, looking east at the Flagstaff Hill Alternative  No photo simulation was created for this KOP.
Key Observation Point - KOP 5-68 203 Hwy Flagstaff Alternative		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Wide, open foreground, gently rolling hills in background	Dense carpet of low lying grasses throughout the viewshed	Flat road, thin road sign. Fence line and sporadic fence posts. Solid, angular structures. Several transmission lines in viewshed.
LINE	Horizontal landscape. Undulating ridgeline in background mountains	Soft, irregular lines along road; vertical sagebrush and grasses	Strong, bold vertical lines of road edge; vertical fence posts, road sign and transmission poles
COLOR	Brown, red with dark highlights; bluish hues due to atmospheric haze	Gold, bold grey blue hues, tans, yellow	Dark grey, brown, blue reflective, tan/white
TEXTURE	Smooth, uniform and undulating middle ground mountains	Medium carpet of sagebrush in foreground and middle ground becoming denser and more even in the middle ground	Smooth, fine surface of road and structures.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Simple geometric forms created by pads for towers foundations and access roads.	Limited vegetation for tower pads and access roads potentially visible from KOP.	Tall, angular lattice towers
LINE	Hard lines of tower pads and curving edges of access roads possibly visible.	Hard lines of roads from vegetation clearing	Several vertical towers would be visible along the skyline creating a vertical intrusion against the horizontal skyline. Hard lines from access roads would produce a high level of contrast against the curving terrain and vegetation.
COLOR	Greys/concrete from tower pads	Browns and reds from exposed soil due to vegetation clearing.	Additional grey/steel visible
TEXTURE	No proposed changes to land/water would be visible	Potential smoothing of surface currently covered by coarse vegetation.	Tall, smooth angular lattice towers visible.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

Visibility of the Flagstaff alternative is significant from this KOP. The route is noticeable in the immediate foreground (.40 mile) of this KOP as it crosses Hwy 203 after travelling the length of the valley floor against the low backdrop of adjacent terrain. The distance from the identified KOP of .40 miles for the Flagstaff alternative brings the details of the lattice structures into view which is only softened somewhat by this alternative having a uniform backdrop over its length. The Flagstaff alternative would be seen at approximately 1/5 inch structure heights at distance, which have no natural and few manmade features present to reduce contrast at this range.

The visibility of the lattice features of the Flagstaff alternative, although situated in a semi-panoramic limited landscape, begins to dominate the overall landscape features from this KOP. However, this KOP is situated along a travel corridor and would be viewed primarily by individuals travelling Hwy 203. It is estimated that the length of time these views are prominent to visitors is approximately 30 seconds to one minute from this KOP until passing under the line.

Backdrops exist for the entire Flagstaff alternative when viewed from this KOP. Overall, the effect on the landscape is significant at this site but reduced by the limited view and shortened timeframes the project is seen by the casual observer. Although the project will be noticeable to the casual observer, it would not violate the current VRM IV classification. The reflectivity of the project would occur primarily during mid to late afternoon hours.

The development of the project at this location does not exist on BLM lands and is therefore outside of the influence of BLM mitigations.

Additional Mitigating Measures (See item 3)

*Since the project does not exist on BLM lands except at extreme distances which require no mitigation, the following mitigations are only recommendations to help alleviate public concerns and sensitivities.*

Proposed route:

- Micro site route to reduce skylining.
- Minimize side casting during road construction where cuts are visible from KOP.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to create brownish colors (whichever is more absorbed by the landscape at this distance).
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Wide, open foreground, gently rolling hills in background	Dense carpet of low lying grasses throughout the viewshed	Flat road, thin road sign. Fence line and sporadic fence posts. Solid, angular structures. Several transmission lines in viewshed.
LINE	Horizontal landscape. Undulating ridgeline in background mountains	Soft, irregular lines along road; vertical sagebrush and grasses	Strong, bold vertical lines of road edge; vertical fence posts, road sign and transmission poles
COLOR	Brown, red with dark highlights; bluish hues due to atmospheric haze	Gold, bold grey blue hues, tans, yellow	Dark grey, brown, blue reflective, tan/white
TEXTURE	Smooth, uniform and undulating middle ground mountains	Medium carpet of sagebrush in foreground and middle ground becoming denser and more even in the middle ground	Smooth, fine surface of road and structures.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Simple geometric forms created by pads for towers foundations and access roads.	Limited vegetation for tower pads and access roads potentially visible from KOP.	Tall, angular lattice towers
LINE	Hard lines of tower pads and curving edges of access roads possibly visible.	Hard lines of roads from vegetation clearing	Several vertical towers would be visible along the skyline creating a vertical intrusion against the horizontal skyline. Hard lines from access roads would produce a high level of contrast against the curving terrain and vegetation.
COLOR	Greys/concrete from tower pads	Browns and reds from exposed soil due to vegetation clearing.	Additional grey/steel visible
TEXTURE	No proposed changes to land/water would be visible	Potential smoothing of surface currently covered by coarse vegetation.	Tall, smooth angular lattice towers visible.

**SECTION D. (Continued)**

Comments from item 2.

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

Visibility of the Proposed route is significant from this KOP and is noticeable in the immediate foreground (.80 mile) with the Proposed route being intermittently skylined as it crosses Hwy 203 and where it drops back to the Baker valley floor. For the proposed route the details of the lattice structure are clearly discernable at the distance range of .80 to 1.2 miles as it travels to the northeast, but contrast the landscape to a great extent by the upward view and sky lining of the project in two locations over that distance. The scale of the Proposed route would be approximately ¼ inch when viewed from the KOP on the landscape at distance and has no natural or manmade features present to reduce contrast.

The visibility of the lattice features, although situated in a semi-panoramic limited landscape, strongly impacts the viewshed and the landscape as a result of being skylined in places. However, this impact is softened somewhat by the limited and intermittent views of this routes. However, this KOP is situated along a travel corridor and would be viewed primarily by individuals travelling Hwy 203. It is estimated that the length of time these views are prominent to visitors is approximately 30 seconds to one minute from this KOP until passing under the line (1.08 miles for the Proposed route).

Backdrops exist for sections of the Proposed route when viewed from this KOP. Overall, the effect on the landscape is significant at this site but reduced by the limited view and shortened timeframes the project is seen by the casual observer. Although the project will be noticeable to the casual observer, it would not violate the current VRM IV classification. The reflectivity of the project would occur primarily during early morning hours from backlighting and mid to late afternoon hours via direct lighting.

The development of the project at this location does not exist on BLM lands and is therefore outside of the influence of BLM mitigations.

Additional Mitigating Measures (See item 3)

*Since the project does not exist on BLM lands except at extreme distances which require no mitigation, the following mitigations are only recommendations to help alleviate public concerns and sensitivities.*

Proposed route:

- Micro site route to reduce skylining.
- Minimize side casting during road construction where cuts are visible from KOP.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to create brownish colors (whichever is more absorbed by the landscape at this distance).
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) and the 1989 RMP lists the area as a VRI II/VRM II viewshed respectively.

While existing on private lands through this viewshed with only small visible portions of the route crossing BLM lands at background distances, the impacts to the visual classifications of the BLM lands are minimal. However, for the purpose of VRI/VRM modification, this segment of the line is analyzed.

With a commanding view of the region from this KOP, the Timber Canyon alternative is visible and is situated directly within the foreground at a distance of approximately 1.2 miles at its closest point. The downward views from this KOP towards the route make it visible on the landscape at the 1.2 mile distance with significant textured and complex backdrop landscapes in a panoramic landscape which significantly reduce/eliminate the contrast of the project. Distance, scale, aspect, vegetation and terrain along with manmade features all play a part in the minimization of the visual contrast. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 158°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately superior. With all of these factors combined, the visual contrast for the project would still be noticeable to the casual observer and would therefore not be in compliance with the VRM II designation.

Reflectivity of the site would be most likely to occur during mid to late morning hours.

**Additional Mitigating Measures (See item 3)**

*Since the project does not exist on BLM lands except at extreme distances which require no mitigation, the following mitigations are only recommendations to help alleviate public concerns and sensitivities.*

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don’t just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM III/IV for visual objectives which was modified to expand VRM classification to encompass 16,000 acres of the viewshed from the interpretive center and trail system.

The Proposed route that is visible to visitors of the National Historic Oregon Trail Interpretive Center from this KOP at a range of 1.06 miles. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 111°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral.

Reflectivity of the Proposed route would be most intense during mid-afternoon hours with alternate backlighting occurring for each segment during mid/late morning. The Proposed route and through the visual impacts analysis from this segment would be directly visible to the casual observer and become a focal point on the landscape but would not violate the VRM III determination for the nationally significant area that exists on the BLM lands. Therefore, the Propose route would comply with the VRM objects for the area from the identified KOP.

Additional Mitigating Measures (See item 3)

Due to the sensitivity of the area as a result of the development of the National Historic Oregon Trail Interpretive Center as well as the designated components of the Oregon Trail ACEC, the following additional mitigations are requested.

Flagstaff Alternative: (not on BLM lands so mitigations are just a recommendation to minimize impacts to sensitive area)

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI II viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

The Proposed Route is the only route visible from this KOP and the majority of the project at this location does not exist on BLM lands and is therefore outside of the influence of BLM mitigations. However, the view from this KOP is analyzed due to the sensitivity of travelling this section of Hwy 203.

While existing primarily on private lands through this viewshed at a visual distance of .69 miles with only a small visible portion of the Proposed route crossing BLM lands in the Magpie peak area at a distance of 4.3 miles. The level views from this KOP towards the Proposed routes are significant at the closer distance and appear only slightly perceivable on the landscape for the BLM lands on Magpie Peak with the backdrop features. The surrounding hillsides and extended views significantly reduce/eliminate the contrast. Distance, aspect, vegetation and terrain reduce the distant view contrasts, but have little effect on the closer view. Scale of the structures would range from approximately 1/2" in height at the nearest distance to almost unperceivable for the BLM lands 4.3 miles away. Reflectivity of the site would be most likely to occur during early to mid-morning hours but would be negligible at the project distances.

All of these factors indicate that the project should not attract the attention of the casual observer and would be in compliance with VRM IV designation for the area.

The majority of the project at this location does not exist on BLM lands and is therefore outside of the influence of BLM mitigations.

Additional Mitigating Measures (See item 3)

None

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) and the 1989 RMP lists the area as a VRI II/VRM II viewshed respectively.

The Timber Canyon alternative is the only route visible from this KOP which is situated directly under the route line with a northern enclosed field of view due to hillside to east of location and only depicts the presence of the line as it sits in the Sparta area. From this KOP alone, with the transmission line directly overhead, the Timber Canyon alternative lies at a distance of 4.7 miles which places it within the middle ground views. The downward views from this KOP towards the route make it unperceivable on the landscape at the distances identified with the backdrop landscapes. The surrounding hillsides and extended and panoramic views significantly reduce/eliminate the contrast. Distance, scale, aspect, vegetation and terrain all play a part in the elimination of the visual impacts. All of these factors indicate that the project as it stands from this KOP should not attract the attention of the casual observer and would be in compliance with VRM II designation.

Although not changing the location of the KOP, a linear assessment of visual contrast for BLM lands follows.

Approximately 1 mile further north on the Daly Creek Road from the defined KOP, the Timber Canyon alternative becomes visible on BLM lands at a distance of .67 miles. At this distance significant details of the transmission line and lattice structures become more evident and attention of the casual viewer is easily captured. The transmission line roughly parallels the Daly Creek road and is clearly visible within a relatively consistent .60 mile distance until the road departs from the ridge and drops into the Daly Creek drainage. Segments of the Timber Canyon alternative are sky lined in this area adding to the visual contrast. Terrain backdrops do exist for most of the length of this alternative but are smooth to rolling with limited texture to break up tower patterns. The line is not visible to the casual observer again until 1.22 miles later when the line is seen as it crosses the Daly Creek Road. From this point, the transmission line grows in view over the next .61 miles until travelers pass beneath the line. Again, the line is backdropped in this lower Daly Creek area by the Richland valley with numerous natural features as well as agricultural features to dissolve the pattern until the scale of the project dominates the view due to proximity.

Overall, the length of time the project is in view on the BLM lands is minimal. For both sections where the project is visible while on BLM, the estimated time the project can be viewed is 2-3 minutes. For the southern portion of the view, the line is backdropped and is parallel to the focus point of the viewer. For the northern section, the project comes into view when it changes direction and becomes perpendicular to the line of travel to the viewers but is backdropped by the Richland valley floor.

The combination of upward, level and downward views from this linear assessment of the route both reduce and increase the contrast of the project with the proximity to the viewer adding another negative aspect. The surrounding hillsides and extended/panoramic views, and along with the typical focus point of the casual user reduce but do not eliminate the contrast of the project. All of these factors indicate that the project would, at a minimal level due to travel time, attract the attention of the casual observer and therefore would not be in compliance with VRM II designation.

Reflectivity of the site would be most likely to occur during early to mid to late afternoon hours. The Scale of the project would be approximately 1/2 inch in size for the views from the linear assessment and unperceivable for the distant views from the identified KOP.

While existing primarily on private lands through this viewshed with only small visible portions of the route crossing BLM lands, the impacts to the visual classifications are still easily noticeable. Since the area is being managed as a VRM II and inventoried at that same level (VRI II), the intrusions violate the classifications of the BLM visual management objectives.

**Additional Mitigating Measures (See item 3)**

For BLM lands:

- Micro site towers to avoid skylining from the Daly Creek road.
- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey and/or use galvanized metal stain to develop brownish colors of visible towers (whichever is more readily absorbed by the landscape)
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact

- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) and the 1989 RMP lists the area as a VRI II/VRM II viewshed respectively.

While existing on private lands through this viewshed with only small visible portions of the route crossing BLM lands at background distances, the impacts to the visual classifications of the BLM lands are minimal. However, for the purpose of VRI/VRM modification, this segment of the line is analyzed.

With a commanding view of the region from this KOP, the Timber Canyon alternative is visible and is situated directly within the foreground at a distance of approximately 1.2 miles at its closest point. The downward views from this KOP towards the route make it visible on the landscape at the 1.2 mile distance with significant textured and complex backdrop landscapes in a panoramic landscape which significantly reduce/eliminate the contrast of the project. Distance, scale, aspect, vegetation and terrain along with manmade features all play a part in the minimization of the visual contrast. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 158°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately superior. With all of these factors combined, the visual contrast for the project would still be noticeable to the casual observer and would therefore not be in compliance with the VRM II designation.

Reflectivity of the site would be most likely to occur during mid to late morning hours.

Additional Mitigating Measures (See item 3)

*Since the project does not exist on BLM lands except at extreme distances which require no mitigation, the following mitigations are only recommendations to help alleviate public concerns and sensitivities.*

- Minimize side casting during road construction where cuts are visible from KOP.
- Maintain edge vegetation to minimize road and pad visibility.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don’t just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 51' 05.56" N 117° 13' 53.12" W	5. Location Sketch/Notes  KOP 5-79 is located on Eagle Creek Road in eastern Baker County, approximately 6 miles northwest of Richland, Oregon. The view orientation is to the west and the Timber Canyon Alternative is approximately 0.5 miles from the KOP.  No Photo simulation was created for this KOP.
Key Observation Point – KOP 5-79 Eagle Creek Road Timber Canyon Alternative		
VRM Class II		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Rolling to rugged terrain in the foreground/midground	Think band of tall, conical conifers; amorphous deciduous trees and shrubs of varying sizes	Flat wide band
LINE	Smooth, curved skyline; thin banded horizontal rock outcroppings	Horizontal, short vertical	Diagonal, converging parallel
COLOR	Browns and greys	Browns, tans yellows, dark greens, olive hues	Light tan, white
TEXTURE	Mostly smooth with patches of medium, coarse rock	Rough in foreground/midground; smooth grassy areas in midground with stippled sagebrush	Fine to smooth

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Simple geometric forms created by pads for towers foundations and access roads.	Limited vegetation for tower pads and access roads potentially visible from KOP.	Tall, angular, geometric lattice towers
LINE	Hard lines of tower pads and curving edges of access roads possibly visible.	Some possible hard lines of roads from vegetation clearing	Several vertical towers would be visible along the ridge creating a vertical intrusion against the horizontal skyline. Hard lines from some access roads would produce a level of contrast against the terrain.
COLOR	Greys/concrete from tower pads possibly visible	Browns and reds, tans from exposed soil due to vegetation clearing.	Additional grey/steel visible
TEXTURE	No proposed changes to land/water would be visible	No proposed changes to vegetation would be visible.	Tall, smooth angular lattice towers visible.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) and the 1989 RMP lists the area as a VRI II/VRM II viewshed respectively.

While the KOP sits on the Eagle Creek Road on private lands, the view from this KOP looks directly up towards the Timber Canyon alternative as it sits on BLM lands at a distance of .24 miles at its closest point, and approximately .51 miles at its farthest when utilizing the linear route of Eagle Creek Road to augment the static KOP. The linear analysis has almost every component of the alternative in extreme foreground view for approximately 3 continuous miles. Most of that route has the transmission line and towers sky lined, and where not sky lined, the route has significant views of the tower access roads, road cut features, lattice structures and transmission lines. At the distance between the road and the route of .2-3 miles for the majority of the road, extreme details of the transmission line and lattice structures become clearly evident and viewer attention is focused on the project within a enclosed landscape. The transmission line parallels the Eagle Creek road over this 3 mile section and is clearly visible until the project departs from the ridge and heads westerly.

The upward views from this KOP and from the linear analysis route towards the project make it highly visible on the landscape with little to no significant backdrop features to reduce the contrast of the project. Distance, scale, aspect, vegetation and terrain work against the project through this location with the distance and aspect being the primary negative contrast components. With all of these factors combined, the visual contrast for the project would significantly attract the attention of the casual observer and dominate the views of the area. Reflectivity of the site would be most likely to occur during mid to late morning hours with backlighting in the mid-late afternoon hours offering a shadowed perspective. Scale of the project would have the structures approximately 1-1.25' in height on the landscape at the identified distance.

The impacts to the visual classifications of the BLM lands are significant to extreme and with this area being managed as a VRM II and inventoried at that same level (VRI II), the intrusions violate the classifications of the BLM visual management objectives.

Additional Mitigating Measures (See item 3)

- Move structures #149 - #157 further westward towards the Sparta road a minimum of approximately ¼ mile if not directly adjacent to the road itself.
- Micro site route to ensure towers are not skylined from Eagle Creek Road.
- Minimize side casting during road construction where cuts are visible from KOP and Eagle Creek Road.
- Maintain edge vegetation to minimize road and pad visibility. If not practical, replant appropriate vegetation to break up pattern.
- Utilize concrete stains to blend concrete surfaces to more natural color tones
- Utilize non-reflective galvanized lattice towers (double dipped) to bring color to a medium/dark grey or galvanized metal stains to reach a brownish color tone (whichever is more absorbed by the landscape).
- During road construction, remove, bury or relocate large rocks or debris if their presence would create another linear visual impact
- Utilize natural terrain features for road placement to minimize views. (i.e. don't just follow the powerline route if a meandering road will be less visible.)
- Utilize re-contouring of disturbed lands to conform to pre-construction conditions where practical.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) and the 1989 Baker RMP list the lands associated with the Burnt River alternative a VRI II & VRM II viewshed.

The Burnt River Alternative is viewed from the community of Durkee, OR as well as from the travelers of US 30 and I-84. The project is seen at a distance of 2.10 miles from the static KOP point at the nearest points to the viewer. The placement of the route is back dropped with varied textured terrain with a consistent foreground influence from the KOP, interstate as well as US 30. The terrain offers natural entrenched cuts, vegetation variations, rolling to semi-flattened peaked hillsides as well as some manmade features in the form of roads, structures and agricultural practices in the extreme foreground. Scale of the project at these distances for the tower structure would appear to be approximately 1/8” to 3/16” in size on the landscape. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 155°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral. Although still perceivable, the structures would be small at that distance which would aid in the absorption of the project into the landscape. The primary travelling visibility in this general location would be on I-84 with a moving view of the project alternatives existing for approximately 70-75 seconds. However, views of the project from this KOP are very limited for BLM ownerships with the primary project views seen on private lands. Regardless, the features created by the project would be noticeable to the casual observer and would therefore not comply with the management objectives assigned to the area.

Additional Mitigating Measures (See item 3)

None.

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

The area associated with the visually seen components of the Proposed route are classified within the 2009 VRI inventory and the 1989 RMP as VRI III/VRM III respectively.

Segments of the Proposed route are viewed from the community of Durkee, OR as well as from the travelers of US 30 and I-84. The project is seen at a distance of 1.8 miles for the Proposed route from the static KOP at their nearest points to the viewer. The placement of the route is back dropped with varied textured terrain with a consistent foreground influence from the KOP, interstate as well as US 30. The terrain offers natural entrenched cuts, vegetation variations, rolling to semi-flattened peaked hillsides as well as some manmade features in the form of roads, structures and agricultural practices in the extreme foreground. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 134°. The primary focus of the viewer’s attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. Scale of the project at these distances for the tower structure would appear to be approximately 1/8” to 3/16” in size on the landscape. Although still perceivable, the structures would be small at that distance which would aid in the absorption of the project into the landscape. The primary travelling visibility in this general location would be on I-84 with a moving view of the project alternatives existing for approximately 70-75 seconds. However, views of the project from this KOP are very limited for BLM ownerships with the primary project views seen on private lands. Regardless, the features created by the project would be noticeable to the casual observer but would not begin to dominate the landscape and would therefore comply with the VRM objectives for the area as well as the VRI inventory.

VISUAL CONTRAST RATING WORKSHEET

Date	06/24/2014
District	Vale
Resource Area	Baker
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location 44° 41' 5.17" N 117° 39' 9.54" W	5. Location Sketch/Notes Photo was taken on 9/14/2011 from Alder Creek Road off of Interstate 84, looking North  No photo simulation created for this KOP.
Key Observation Point – KOP 5 – 15 Alder Creek Proposed Route		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Wide, open gently rolling hills; Steeper slopes in back ground	Even carpet of sage brush surrounded by low to medium-lying grasses, patches of individual trees	Flat road; few thing road signs, tall thin utility poles and transmission lines
LINE	Undulating, horizontal ridgelines against sky	Short, vertical grasses and sagebrush; medium height vertical trees	Hard line of road creating a butte edge against adjacent grasses; vertical poles and transmission lines create contrast against horizontal skyline
COLOR	Light browns and tans; blue gray hues	Golden grasses; dark green, blue gray hues	Dark grey, brown/wood
TEXTURE	Smooth, gently curving terrain	Fine, smooth, dense carpet of low-lying grasses and sagebrush; dotted trees throughout landscape	Smooth and fine paved road

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes to land/water would not be visible from KOP.	Possible vegetation clearing in an angular form from tower pads and access roads potentially visible from KOP.	Several tall, angular lattice towers that would be visible in the foreground, middle ground and background
LINE	Changes to land/water would not be visible from KOP.	Hard linear lines of tower pads and curving edges of access roads from vegetation clearing.	Several vertical towers would be visible along the skyline creating a vertical intrusion against the horizontal skyline. Hard lines from access roads would produce a high level of contrast against the curving terrain and vegetation.
COLOR	Changes to land/water would not be visible from KOP.	Browns and reds from exposed soil due to vegetation clearing.	Additional gray/steel visible
TEXTURE	Changes to land/water would not be visible from KOP.	Potential smoothing of surface currently covered by coarse vegetation	Tall, smooth angular lattice towers visible.

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.  DEGREE	FEATURES			2. Does project design meet visual resource Management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)
	LAND/WATER BODY (1)	VEGETATION (2)	STRUCTURES (3)	

OF CONTRAST		Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None
ELEMENTS	Form		X				X			X			
	Line		X				X			X			
	Color			X				X			X		
	Texture				X			X			X		

3. Additional mitigating measures recommended?  
 Yes  No (Explain on reverse side)

Evaluator's Names: Kevin McCoy Date: 06/24/2014

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI III viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

Only an intermittent view of the Proposed route that lies on BLM managed lands can be seen from this KOP at a distance of .80 miles. The view of the Burnt River segment that is visible to travelers on I-84 is approximately 6.3 miles distance which is unperceivable to the casual observer. The segment of the proposed route that is visible at approximately .80 miles brings considerable amounts of detail of the project into clearer view including structures and access road features. However, the intermittent views offered the visitors travelling past this KOP reduces the time in which the contrast is noticed. With the intermittent foreground to middle ground views of the project from the KOP 5-15 while travelling in the direction of the proposed project and alternative, visual perception will be lost between 18-50 seconds at interstate travel speeds of 65 mph.

Both aspects are at angles of less than 10 degrees with textured terrain backdrops that will aid in diffusing the contrast. Reflectivity of the site would be most intense during afternoon hours during the summer months. Scale of the project on the landscape will show structures at sizes of ¼ inch on the landscape at distance for the Proposed route of .80 miles for the KOP.

There are minimal visual impacts to public lands from this KOP and therefore no Visual Management objectives will be violated. Additionally, no loss to inventoried visual resources is anticipated.

Additional Mitigating Measures (See item 3)  
 No mitigations are required for this segment from this KOP as no impacts are occurring on BLM lands

Activity (program):  
Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  44° 21' 5.79" N 117° 15' 54.82" W	5. Location Sketch/Notes  Photo was taken on 9/14/2011 from a residential area off of Washington Street in the town of Huntington, OR looking west and northwest.  No Photo simulation has been created.
Key Observation Point – KOP 5-5 Huntington, Oregon Compared to Tub Mountain Alternative		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Flat valley floor enclosed by surrounding rolling terrain	Clumped and irregular	Solid structures, tall thin utility poles, fence lines
LINE	Horizontal landscape with undulating mountainous ridgelines in the background	Vertical low-lying grasses and shrubs; vertical trees with circular irregular canopies; linear band in landscape	Hard angular lines of building, and railway. Vertical lines of utility poles, irregular circular canopies penetrate skyline
COLOR	Dark brown/black, light and dark tan and beige, reds with gray blue hues, grays	Dark and light greens, olive, gray hues, beige and tan, browns	Dark and light grays, gray fence lines and posts, black, white, browns
TEXTURE	Smooth and rolling in back ground	Medium to coarse, patchy	Grainy, flat gravel surface in foreground, patchy medium grasses

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Possible visibility of a few, short angular towers in the background contrasting against terrain.
LINE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Possible vertical lines from transmission line in background; if visible, lines would be faint and consistent with existing vertical lines in the viewshed.
COLOR	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	The gray lines of the galvanized steel towers against the lighter colors of background terrain would partially absorb towers
TEXTURE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Potential for dotted towers to be visible. If visible, these would be partially absorbed by the existing variety of textures in the landscape.

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.  DEGREE  OF  CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)

**SECTION D. (Continued)**

Comments from item 2.

**Assumptions on Distance Zones:** Contrast rating distance Foreground/Middle Ground = 0-5 miles. Project specific Distance zones for KOPs - Foreground = within .5 mile of KOP and for Middleground = within 5 miles of KOP

Visual Resource Inventory (2009) lists the area as a VRI III viewshed. However, current RMP direction lists the area as a VRM IV for visual objectives.

The view of the Tub Mountain South segment that lies on BLM lands is approximately 1.27 miles in length with an upward viewing aspect and textured terrain backdrops with some skylining of project components. . From the KOP 5-5 and travelling in the direction of the proposed project, visual perception will be lost within .15 miles distance for the Tub Mountain South alternative. Travel speeds of 30-40 mph will keep the project visible for 15-40 seconds with a focused intent on viewing, yet the casual observer will not be impacted by its presence. Residents with a prolonged view will notice the developments on the public lands and private lands at a distance of 1.27miles further defusing/reducing the amount of visual intrusion. Size of the project will be approximately 3/16 to 1/8 inches in scale at the distances viewed from the KOP. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 0°. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 45°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior.

Reflectivity of the site would be most intense in the morning hours as the project would lie due west of the KOP location and city of Huntington, Oregon.

Visual Management objectives will be met.

Additional Mitigating Measures (See item 3)

No mitigations are required for this segment from this KOP

**SECTION D. (Continued)**

The KOP is located in an enclosed landscape that includes rolling hills. Traveling eastbound in the foreground (FG) of the proposed project, the project components would be predominately skylined and unobstructed and continuous. In the middleground (MG), the project components would be predominately skylined and partially obstructed and intermittent. Travelling westbound in the FG of the proposed project, the project components would be predominately skylined and partially obstructed and intermittent. In the MG, the project components would be equally backdropped against rolling hills and skylined, as well as partially and intermittent. Dominant lines include the horizontal ridgelines and contrasting vertical transmission lines/utility poles spread through the landscape. The hard lines of US 20 create a hard line against the adjacent rolling hills of grassland. Dominant colors in the viewshed have light undertones of gray, green, yellow and beige.

**SECTION D. (Continued)**

The KOP is located in an enclosed landscape that includes rolling hills. Traveling eastbound in the foreground (FG) of the proposed project, the project components would be predominately sky lined and unobstructed and continuous. In the middle ground (MG), the project components would be predominately sky lined and partially obstructed and intermittent. Travelling westbound in the FG of the proposed project, the project components would be predominately sky lined and partially obstructed and intermittent. In the MG, the project components would be equally back dropped against rolling hills and sky lined, as well as partially and intermittent. Dominate lines include the horizontal ridgelines and contrasting vertical transmission lines/utility poles spread through the landscape. Dominant colors in the view shed have light undertones of gray, green, yellow and beige.

**SECTION D. (Continued)**

KOP platform is located in a panoramic landscape that includes broad valley. In the foreground (FG), the project components would be equally backdropped against low rolling hills and partially obstructed. In the middleground (MG), the project components would be equally backdropped and skylined against low rolling hills and partially obstructed. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 90°. There are 6.37 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately 0.00 miles of the project components would be seen in the FG and .86 miles would be seen in the MG of the stationary platform, which would represent 13 percent of the total miles of the project components within the FG and MG of the platform. The viewer position would be predominately neutral. The project components would begin to attract attention and be visually subordinate the visual setting within the FG of the stationary KOP platform and the landscape would appear to be slightly altered. In the MG area, the stationary KOP platform would begin to attract attention and be visually subordinate in the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be slightly altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 1.0 because the landscape does not have features that would attract your attention.

LINE	Horizontal ridgelines	Short, vertical; hard line of vegetation against road surface	Hard lines of road surface against the vegetation; tall vertical transmission poles; short vertical fence posts with apparent horizontal fence lines
COLOR	Dark brown, light and dark gray; light tan; white (snow); raw sienna; bluish hues in background due to atmospheric conditions	Brown; grey hues; tans; olives, light green	Light browns/tans/beige, greens with gray/blue hues
TEXTURE	Smooth and undulating	Fine grasses and medium shrubs	Smooth, and fine surface of road; smooth surfaces of Fence and poles

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes would not be visible from KOP.	Changes would not be visible from KOP.	Few short, angular lattice towers in middle ground
LINE	Changes would not be visible from KOP.	Changes would not be visible from KOP.	Complex, angular lattice tower; thin, curving, parallel lines of conductors
COLOR	Changes would not be visible from KOP.	Changes to vegetation not apparent from KOP	Dark grayish blue, light grey, dark grey, metallic, dull chroma
TEXTURE	Changes would not be visible from KOP.	Patchy opening in the vegetation	Contrasting, dotted towers; smooth, metallic finish of structures

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.  DEGREE  OF  CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)

Texture			X		X					X	

SECTION D. (Continued)

The KOP is located in an enclosed landscape that includes rolling hills. Traveling eastbound in the foreground (FG) of the proposed project, the project components would be predominately sky lined and unobstructed and continuous. In the middle ground (MG), the project components would be predominately sky lined and partially obstructed and intermittent. Travelling westbound in the FG of the proposed project, the project components would be predominately sky lined and partially obstructed and intermittent. In the MG, the project components would be equally back dropped against rolling hills and sky lined, as well as partially and intermittent. Dominate lines include the horizontal ridgelines and contrasting vertical transmission lines/utility poles spread through the landscape. The hard lines of US 20 create a hard line against the adjacent rolling hills of grassland. Dominant colors in the view shed have light undertones of gray, green, yellow and beige.

VISUAL CONTRAST RATING WORKSHEET

Date	06/26/2014
District	Vale
Resource Area	Malheur
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location  43° 44' 12.62" N -117° 11' 1.68" W	5. Location Sketch/Notes  Photo was taken on 9/13/2011 from Watchable Wildlife Area's parking lot off Owyhee Lake Road, looking north and northeast
Key Observation Point – KOP 8-52 –Compare to Malheur A & Malheur S		
VRM Class I		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Flat, valley foreground surrounded by hills with flat-top mesas in the middleground and background; spherical rock formation in foreground	Short to medium grasses and circular shrubs; few medium sized irregular circular trees	Flat gravel surface parking lot; long rectangular parking barriers and fence line, distinct long linear pipeline in middle ground
LINE	Dominant horizontal, broken skyline with apparent striated rock bands; dotted rocks on lower slopes; sharp linear edges of parking lot	Linear band of shrubs outlining road and parking area; vertical, irregular canopies	Sharp straight linear lines of parking area edges and parking barriers, thick linear line of pipeline in middleground
COLOR	Light and dark browns, reds/maroon with blue/gray hues	Light beige, tans, and umber; dark green with blue undertones of trees	Light gray parking area, brown/wood parking barrier, light gray pipeline
TEXTURE	Fine textured lower slopes contrasting with rough mountain tops; hills with no vegetation are rugged sharp and steep	Fine low lying grasses and shrubs; coarse trees in foreground; fine trees in middle ground and background	Flat grainy parking area, smooth parking barriers, smooth, shiny pipeline.

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Short, flat areas created where tower pads are created over hilly terrain in middleground.	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middleground	Several angular lattice towers may be visible in a natural depression in the terrain in the background. Cable conductors would be visible spanning the valley.
LINE	Short, straight, horizontal created by tower pads	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middleground	Lines of the lattice structure and linear lines would span the valley.
COLOR	Lighter tans, beige, red,	Vegetation (shrubs/grasses) would be removing some green and golden yellow color within the middleground	Gray metallic structures, balls on the line, and line would span canyon.
TEXTURE	Fine Texture	Vegetation would be removed, removing some of the fine texture created by them	Sharp contrast of fine texture against smooth line and lattice towers

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

**SECTIOND. (Continued)**

In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 90°. The primary focus of the viewer’s attention is Aqeaduct from which the project components would be in view. The viewer position would be predominately inferior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 180°. The primary focus of the viewer’s attention within the MG is canyons from which the project components would be in view. The viewer position would be predominately inferior. There are 29.58 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately 1.21 miles of the project components would be seen in the FG and 18.51 miles would be seen in the MG of the stationary platform, which would represent 67 percent of the total miles of the project components within the FG and MG of the platform. The project components would demand attention and dominate the visual setting within the FG of the stationary KOP platform and the landscape would appear to be heavily altered. The scenic quality rating for areas seen within the FG of the stationary KOP platform would decrease by 2.0 points because the KOP location’s purpose is for recreational viewing of wildlife and the surrounding canyon . In the MG area, the stationary KOP platform would demand attention and dominate the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be heavily altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 2.0 points because KOP location’s purpose is for recreational viewing of wildlife and the surrounding canyon. (The project components would be similar in appearance to existing 500kv transmission lines within 5.7 miles of this alternative.)

SECTION D. (Continued)

Burnt Mountain Wilderness Inventory Unit KOP platform is located in a landscape that includes landscape that includes canyons/cliffs and defined valley). In the foreground (FG), the project components would be equally back dropped and sky lined against canyons and intermittent. In the middle ground (MG), the project components would be equally back dropped and sky lined against canyons and intermittent. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 360°. The primary focus of the viewer’s attention is the Owyhee Canyon from which the project components would be in view. The viewer position would be predominately inferior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 90°. The primary focus of the viewer’s attention within the MG is Owyhee Canyon from which the project components would be in view. The viewer position would be predominately neutral. There are 6.25 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately .14 miles of the project components would be seen in the FG and .28 miles would be seen in the MG of the stationary platform, which would represent 7 percent of the total miles of the project components within the FG and MG of the platform. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be substantially altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 2.0 points because scenic canyon attracts many recreationists for the pristine views the new vertical towers would distract from canyons and cliff landforms. (The project components would be similar in appearance to existing 500kv transmission lines within .96 miles of this KOP.)

Form 8400-4  
(September 1985)

VISUAL CONTRAST RATING WORKSHEET

Date	06/26/2014
District	Vale
Resource Area	Malheur
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location 43° 41' 41.33" N -117° 23' 37.08" W	5. Location Sketch/Notes KOP 8-85 is located at the intersection of Twin Springs Road and Rock Canyon Road in an undeveloped part of northern part of Malheur County.
Key Observation Point - KOP 8-85 -Malheur A		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Flat, valley foreground surrounded by rolling and dramatic buttes in the foreground/middle ground	Dense to medium carpet of low to medium-lying sagebrush and grasses	Banded, flat (road); short, linear, indistinct (transmission structures)
LINE	Undulating horizontal ridge, horizontal flat	None apparent	Curving
COLOR	Medium tan to dark brown (rock outcroppings)	Yellow-greens, browns, tans, greys	Grey tones (road, transmission structures)
TEXTURE	Fine textured lower slopes contrasting with rough mountain tops; hills with no vegetation are rugged sharp and steep	Medium to coarse in foreground becoming smoother due in the middle ground and background	Medium to fine gravel, indistinct (transmission structures)

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Short, flat areas created where tower pads are created over hilly terrain in middle ground.	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middle ground	Several angular lattice towers may be visible in a natural depression in the terrain in the background. Cable conductors would be visible spanning the valley.
LINE	Short, straight, horizontal created by tower pads	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middle ground	Lines of the lattice structure and linear lines would span the valley.
COLOR	Lighter tans, beige, red,	Vegetation (shrubs/grasses) would be removing some green and golden yellow color within the middle ground	Gray metallic structures, balls on the line, and line would span canyon.
TEXTURE	Fine Texture	Vegetation would be removed, removing some of the fine texture created by them	Sharp contrast of fine texture against smooth line and lattice towers

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.	DEGREE OF CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No (Explain on reverse side)
		LAND/WATER BODY (1)				VEGETATION (2)				STRUCTURES (3)				
		Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	3. Additional mitigating measures recommended? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)
ELEMENTS	Form			x				x		x				
	Line			x				x		x				

Color				x			x		x			
Texture				x			x		x			

**SECTIOND. (Continued)**

Sourdough Mountain Wilderness Inventory Unit – Twin Springs Road KOP platform is located in a panoramic landscape that includes broad valley. In the foreground (FG), the project components would be predominately back dropped against rolling hills and continuous. In the middle ground (MG), the project components would be predominately sky lined against rolling hills and continuous. There are 23.35 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately .89 miles of the project components would be seen in the FG and .09 miles would be seen in the MG of the stationary platform, which would represent 4 percent of the total miles of the project components within the FG and MG of the platform. The project components would demand attention and dominate the visual setting within the FG of the stationary KOP platform and the landscape would appear to be heavily altered. The scenic quality rating for areas seen within the FG of the stationary KOP platform would decrease by 2.0 points because the valley is absent of any other structures in a narrow valley. In the MG area, the stationary KOP platform would demand attention and dominate the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be heavily altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 2.0 points because the valley is absent of any other structures in a narrow valley. (The project components would be similar in appearance to existing 500kv transmission lines within 3.25 miles of this alternative.)

SECTION D. (Continued)

In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 360°. The primary focus of the viewer's attention is nonspecific from which the project components would be in view. The viewer position would be predominately inferior). In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 75°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately inferior. There are 13.45 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately 0.00 miles of the project components would be seen in the FG and 1.56 miles would be seen in the MG of the stationary platform, which would represent 12 percent of the total miles of the project components within the FG and MG of the platform. The project components be visually prominent, and begin to dominate the visual setting within the FG of the stationary KOP platform and the landscape would appear to be substantially altered. The scenic quality rating for areas seen within the FG of the stationary KOP platform would decrease by 1.0 because the area is void of any linear structures. In the MG area, the stationary KOP platform be visually prominent, and begin to dominate the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be substantially altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 1.0 because the area is void of any linear structures.

**SECTION D. (Continued)**

Double Mountain Wilderness Inventory Unit Characteristic Area – Twin Springs Road KOP platform is located in a panoramic landscape that includes a broad valley. In the foreground (FG), the project components would not be visible. In the middleground (MG), the project components would be predominately back dropped against rolling hills and intermittent. In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 45°. The primary focus of the viewer's attention is nonspecific from which the project components would be in view. The viewer position would be predominately neutral. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 45°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral. There are 25.39 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately 0.00 miles of the project components would be seen in the FG and 1.49 miles would be seen in the MG of the stationary platform, which would represent 6 percent of the total miles of the project components within the FG and MG of the platform. The project components would begin to attract attention in the visual setting within the FG of the stationary KOP platform and the landscape would appear to be slightly altered. The scenic quality rating for areas seen within the FG of the stationary KOP platform would not change because the project components are not visible. In the MG area, the stationary KOP platform would begin to attract attention and be visually subordinate the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be slightly altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by 0.5 because another transmission line already exists in the area. In the MG area, the stationary KOP platform. The project components would be similar in appearance to existing 500kv transmission lines within 3.38 miles of this alternative.

FORM	Rolling to rugged terrain in foreground, middle, and background with rock outcrops and some horizontal bands of rough rocks	Short, low lying grasses with scattered patches of shrubs/sagebrush	Gravel surfaced road, convergent horizontal band
LINE	Curving and pointed undulating lines and silhouettes with bold rocky bands along ridges	Scattered vegetation with no discernible line other than weak edges of clustered sagebrush vegetation	Linear edge of gravel road against surrounding vegetation, linear convergent band
COLOR	red, gray and sienna hues	yellow and tan grasses as well as olive sagebrush	Gray gravel surfaced road
TEXTURE	Fine textures slopes and ridges with interspersed patches of rough rock outcropping	Expanses of low lying grasses and clusters of shrubs in the foreground to middleground	Grainy surface of gravel road

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Possible simple geometric forms created by pads for tower foundations and access roads; not visible from KOP, possibly noticeable from more elevated points nearby	Possible vegetation clearing in geometric forms for tower pads and access roads; not visible from KOP, possibly noticeable from more elevated points nearby	Tall, angular lattice towers, likely seen against terrain.
LINE	Hard linear lines of tower pads and curved edges of access roads, not likely noticeable at this distance	Hard lines of tower pads and access roads where vegetation is cleared possible, not likely noticeable from KOP	Several vertical towers likely visible, probably seen against terrain.
COLOR	Grays and tans	Browns and red hues possibly visible if vegetation is cleared and soil exposed	Flat gray, metallic
TEXTURE	Smooth	patchy if vegetation clearing is discernable	smooth

SECTION D. CONTRAST RATING  SHORT TERM  LONG TERM

1.	DEGREE OF CONTRAST	FEATURES												2. Does project design meet visual resource management objectives? <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No (Explain on reverse side)
		LAND/WATER BODY (1)				VEGETATION (2)				STRUCTURES (3)

SECTION D. (Continued)

Double Mountain Wilderness Inventory Unit – Negro Rock Creek Middle KOP platform is located in a panoramic landscape that includes broad valley landscape that includes defined valley. In the foreground (FG), the project components would not be visible. In the middleground (MG), the project components would be equally backdropped against rolling hills and partially obstructed. There are 9.1 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Approximately 0.00 miles of the project components would be seen in the FG and .03 miles would be seen in the MG of the stationary platform, which would represent .3 percent of the total miles of the project components within the FG and MG of the platform. The project components would begin to attract attention and be visually subordinate the visual setting within the FG of the stationary KOP platform and the landscape would appear to be slightly altered. The scenic quality rating for areas seen within the FG of the stationary KOP platform would not change because . In the MG area, the stationary KOP platform would begin to attract attention and be visually subordinate in the the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be slightly altered. The scenic quality rating for areas visible within the MG of the stationary KOP platform would decrease by (0.5 because the route would be pararell to the road with defined rolling hills blocking most of the view.

VISUAL CONTRAST RATING WORKSHEET

Date	06/26/2014
District	Vale
Resource Area	Malheur
Activity (program)	Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION		
Project Name - Boardman to Hemingway Transmission Line	4. Location 43° 44' 12.62" N -117° 11' 1.68" W	5. Location Sketch/Notes  KOP 8-95 is located at the entrance to a short spur loop road from the Owyhee Lake Road in the Lower Owyhee Canyon.
Key Observation Point - KOP 8-95 -Malheur A		
VRM Class I		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Flat, valley foreground surrounded by hills with flat-top mesas in the middleground and background; spherical rock formation in foreground	Short to medium grasses and circular shrubs; few medium sized irregular circular trees	Flat gravel surface and smooth paved surface, buildings in the middle ground
LINE	Dominant horizontal, broken skyline with apparent striated rock bands; dotted rocks on lower slopes;	Linear band of shrubs outlining road and parking area; vertical, irregular canopies	Sharp straight linear lines of parking area edges and parking barriers, rectangular buildings in middleground
COLOR	Light and dark browns, reds/maroon with blue/gray hues	Light beige, tans, and umber; dark green with blue undertones of trees	Light gray parking area, brown/wood parking barrier,
TEXTURE	Fine textured lower slopes contrasting with rough mountain tops; hills with no vegetation are rugged sharp and steep	Fine low lying grasses and shrubs; coarse trees in foreground; fine trees in middle ground and background	Flat grainy parking area,

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Short, flat areas created where tower pads are created over hilly terrain in middleground.	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middleground	Several angular lattice towers may be visible in a natural depression in the terrain in the background. Cable conductors would be visible spanning the valley.
LINE	Short, straight, horizontal created by tower pads	Vegetation (shrubs/grasses) would be removed, creating small, regular patches in the uniform covered middleground	Lines of the lattice structure and linear lines would span the valley.
COLOR	Lighter tans, beige, red,	Vegetation (shrubs/grasses) would be removing some green and golden yellow color within the middleground	Gray metallic structures, balls on the line, and line would span canyon.
TEXTURE	Fine Texture	Vegetation would be removed, removing some of the fine texture created by them	Sharp contrast of fine texture against smooth line and lattice towers

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** China Ditch Road Rural Residential Area KOP platform would be approximately 0.9 miles (access roads) and 0.6 miles (transmission lines) from the nearest visible project components. Proposed transmission lines and towers, as well as access roads, would be visible. An existing 500kv transmission line is located approximately 0.2 miles southwest of this KOP, and an existing substation is located 0.3 miles north of the KOP.

Current RMP direction lists the area as a VRM IV for visual objectives.

China Ditch Road Rural Residential Area KOP platform is located in a panoramic landscape that includes flat wide open plains, slightly rolling terrain, with a partial view of mountains and a flat top mesa. In the foreground (FG) the project components would not be seen. In the middleground (MG), the project components would be equally backdropped and skylined against low lying hills and a flat top mesa in the distance, and would be obstructed and continuous.

In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 300°. The primary focus of the viewer's attention within the MG is the substation from which the project components would be in view. The viewer position would be predominately neutral.

There are 20 miles of the project components within the MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately 5.9 miles of the project components would be seen in the MG of the stationary platform, which would represent 29.3 percent of the total miles of the project components within the MG of the platform.

In the MG area, the stationary KOP platform would begin to attract attention and be visually subordinate to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be slightly altered. The areas visible within the MG of the stationary KOP platform would not change due to the fact that a substation and an existing 500kv powerline currently occupy this area. The proposed project would repeat the form, line, color, texture, and scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within 1 miles of the proposed project.

**Additional Mitigating Measures (See item 3)**

No mitigations are required for this segment from this KOP

***This page intentionally left blank.***

VISUAL CONTRAST RATING WORKSHEET

Date: 06/30/2014
District: Boise
Resource Area: Owyhee
Activity (program): Visual Analysis fieldwork and form

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  43° 26' 03.11" N 116° 51' 39.19" W	5. Location Sketch/Notes
Key Observation Point – <b>KOP 12-18</b> Squaw Creek Marsing, ID		
VRM Class III		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Rolling hill and ridge terrain with jagged rock formations and steeply sloped side walls in the foreground and middleground; undulating surface of the Squaw Creek valley floor also prominent	Patchy, random order	Wide, smooth, flat surface of Hwy 95 and nearby gravel surface road; solid concrete road barriers; linear wood poles
LINE	A mix of horizontal and undulating and irregular horizon lines	Random, no discernible lines from the vegetation	Hard line of Hwy 95 and gravel surface road against the adjacent vegetation
COLOR	Light browns and tans; dark reds, raw and burnt sienna, and blues and brown of rock formations	Umber, blue-gray hues, light and dark greens, and olive	light and dark grays and browns; yellow strip on road
TEXTURE	Coarse, steep, and rough of rock formations	Flat, fine texture of the grasses on the side slopes	Smooth and fine

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Slight potential visibility of transmission towers in small low-lying areas, but elevated terrain would likely block all views of transmission lines
LINE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Changes to vegetation not visible from KOP.
COLOR	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Changes to vegetation not visible from KOP.
TEXTURE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Changes to vegetation not visible from KOP.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Squaw Creek Research Natural Area KOP platform would approximately 2.9 miles (access roads) and 1.5 miles (transmission lines) from the nearest visible project components.

Current RMP direction lists the area as a VRM III for visual objectives.

Squaw Creek Research Natural Area KOP platform is located in an enclosed landscape that includes rolling hills, cliffs, and a defined valley. In the foreground (FG), the project components would not be seen. In the middleground (MG), the project components would be predominately backdropped against rolling hills and mountainous terrain and intermittent.

In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 20°. The primary focus of the viewer's attention within the MG is mountainous terrain and rocky outcroppings from which the project components would be in view. The viewer position would be predominately superior.

There are 23.4 miles of the project components within the MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately 1.8 miles of the project components would be seen in the MG of the stationary platform, which would represent 7.7 percent of the total miles of the project components within the MG of the platform.

In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within 2 miles of the proposed project.

**Additional Mitigating Measures (See item 3)**

No mitigations are required for this segment from this KOP

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  43° 20' 56.94" N 116° 42' 48.43" W	5. Location Sketch/Notes
Key Observation Point – <b>KOP 12-21</b> Wilson Creek Trailhead Marsing, ID		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Gently sloping terrain in the foreground, open, flat and rolling valley floor beyond, and a backdrop of steep to moderately steep canyon slopes and flat mesas on the north side of the river	Low-lying grasses and shrubs; sparse to medium	Gravel surface road; flat parking area; bulbous, irregular boulders, linear trail markers and trails, blocky kiosks and structures; steel, linear transmission line towers
LINE	Dominant lines in the landscape are primarily horizontal	No real discernible vegetation line; random and sporadic	Several vertical intrusions into the skyline from tall, thin transmission towers dotting the landscape; hard lines of Wilson Creek Road
COLOR	Dark overtones consisting of grays and browns	Reds, blues, and greens	Whites, grays, blue, brown
TEXTURE	Coarse on rocky outcrops, smooth on rolling hills	Fine to medium from grasses and low-lying shrubs	Fine, medium and coarse

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Moderate level of transmission tower visibility in areas not blocked by terrain
LINE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Moderate level of visibility in areas not blocked by terrain
COLOR	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Dark gray or metallic surface transmission towers visible in certain areas
TEXTURE	Changes to land/water not visible from KOP.	Changes to vegetation not visible from KOP.	Smooth

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Wilson Creek Trailhead KOP platform would be approximately 1.2 miles (access roads) and 1.7 miles (transmission line) from the nearest visible project components.

Current RMP direction lists the area as a VRM IV for visual objectives.

Wilson Creek Trailhead KOP platform is located in an enclosed landscape that includes rolling hills, rock outcroppings, and cliffs. In the foreground (FG), the project components would not be seen. In the middleground (MG), the project components would be equally backdropped and skylined against rolling hills and flat top mesa, and would be unobstructed and continuous.

In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 65°. The primary focus of the viewer's attention within the MG is nonspecific from which the project components would be in view. The viewer position would be predominately neutral.

There are 28.2 miles of the project components within the MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately 5.2 miles of the project components would be seen in the MG of the stationary platform, which would represent 18.6 percent of the total miles of the project components within the MG of the platform.

In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within .5 miles of the proposed project.

**Additional Mitigating Measures (See item 3)**

No mitigations are required for this segment from this KOP

SECTION A. PROJECT INFORMATION

Project Name - Boardman to Hemingway Transmission Line	4. Location  43° 21' 31.06" N 116° 40' 51.38" W	5. Location Sketch/Notes
Key Observation Point – <b>KOP 12-22</b> Wilson Creek Wayside Marsing, ID		
VRM Class IV		

SECTION B. CHARACTERISTIC LANDSCAPE DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Wide, flat and slightly rolling basin with a slight up slope in the middleground and low-lying hills in the background	Short grasses and low-lying patches of sagebrush scattered throughout viewshed	Tall, lattice structures of existing transmission line; thin visible horizontal cables
LINE	Flat, horizontal basin; undulation diagonal slopes of mountains in background	Dotted sagebrush in random order mixed with vertical grasses; irregular edges of vegetation on ridge	Bold vertical transmission structures with a lattice design
COLOR	dark grayish/blue, brown; light and dark grays, reds, and blues; gray and brown from exposed soils	Dark, vibrant green grasses and sage; light pale and dark tan; pale yellow, dull, grayish brown; dark green/gray	Dull and dark gray transmission structures
TEXTURE	Slightly rolling basin; contrasting, coarse to medium hills; coarse rougher mountains in the background	Continuous, medium patches of short to moderately tall grasses; dotted, sparse patches of sagebrush	Ordered, dotted, contrasting placement of vertical lattice transmission towers

SECTION C. PROPOSED ACTIVITY DESCRIPTION

	1. LAND/WATER	2. VEGETATION	3. STRUCTURES
FORM	Possible simple geometric forms created by pads for tower foundations and access roads; may be partially obscured	Possible vegetation clearing in an angular form from tower pads and access roads potentially visible from KOP	Several tall, angular lattice towers that would be visible in the foreground, middleground, and background
LINE	Hard linear lines of tower pads and curving edges of access roads. May be partially obscured	Hard lines of tower pads and curving edges of access roads from vegetation clearing	Several vertical towers would be visible along the skyline creating a vertical intrusion against the horizon. Hard lines from access roads would produce a high level of contrast against the existing terrain and vegetation
COLOR	Grays from concrete of tower pads; may be visible from KOP. May be partially obscured from distance	Browns and reds from exposed soil due to vegetation clearing	Light and dark gray/blue and metallic finish of towers visible
TEXTURE	Cuts in the land for tower foundations may be visible	Potential smoothing of surface currently covered by coarse vegetation; may be partially obscured	Rough, contrasting arrangement of lattice structures; smooth, uniform metallic finish of lattice towers

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Wilson Creek Wayside KOP platform would be approximately 0.1 miles (access roads) and 0.6 miles (transmission line) from the nearest visible project components. At a straight line distance of approximately 0.6 miles, transmission lines and towers would be visible, but due to the existing cultural modifications in the viewshed, the overall level of contrast would be weak to moderate.

Current RMP direction lists the area as a VRM IV for visual objectives.

Wilson Creek Wayside KOP platform is located in a panoramic landscape that includes a wide, flat, slightly rolling basin with low lying hills and a flat top mesa in the background. In the foreground (FG), the project components would include only access roads. In the middleground (MG), the project components would be predominately skylined with rolling hills in a portion of the backdrop, and would be unobstructed and continuous.

In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 45°. The primary focus of the viewer's attention is the currently existing 500kv powerlines from which the project components would be in view. The viewer position would be predominately neutral. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 180°. The primary focus of the viewer's attention within the MG is currently existing 500kv powerlines from which the project components would be in view. The viewer position would be predominately neutral.

There are 26 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately .32 miles of the project components would be seen in the FG and 3.6 miles would be seen in the MG of the stationary platform, which would represent 1.2 percent of the total miles of the project components within the FG and 13.7 percent within the MG of the platform.

The project components would not attract attention to the visual setting within the FG of the stationary KOP platform and the landscape would appear to be intact. The areas seen within the FG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape. In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within .5 miles of the proposed project.

**Additional Mitigating Measures (See item 3)**

No mitigations are required for this segment from this KOP

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Eastern Terminus – Wilson Cemetery KOP platform would be located on an access road, and would be 0.3 from the nearest visible transmission lines and towers. KOP is located near several existing transmission lines, a power substation and a cemetery in the foreground. As such, the landscape is modified with many vertical intrusions on the skyline, making the overall contrast rating weak.

Current RMP direction lists the area as a VRM IV for visual objectives.

Eastern Terminus – Wilson Cemetery KOP platform is located in a panoramic landscape that includes flat, wide plains with low lying hills and mountainous terrain in the backdrop. In the foreground (FG), the project components would be equally backdropped and skylined against rolling hills and mountainous terrain and unobstructed. In the middleground (MG), the project components would be equally backdropped and skylined against rolling hills and mountainous terrain and unobstructed.

In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 35°. The primary focus of the viewer’s attention is a cemetery and currently existing powerlines, from which the project components would be in view. The viewer position would be predominately neutral. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 125°. The primary focus of the viewer’s attention within the MG is existing powerlines and substation from which the project components would be in view. The viewer position would be predominately neutral.

There are 22.6 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately .7 miles of the project components would be seen in the FG and 2.3 miles would be seen in the MG of the stationary platform, which would represent 2.9 percent of the total miles of the project components within the FG and 10.1 percent within the MG of the platform.

The project components would not attract attention to the visual setting within the FG of the stationary KOP platform and the landscape would appear to be intact. The areas seen within the FG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape. In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within .7 miles of the proposed project.

SECTION D. (Continued)

Comments from item 2.

**Assumptions on Distance Zones:** Hemingway Butte OHV KOP platform is approximately 0.7 miles (access roads) and 0.6 miles (transmission line) from the nearest visible project components.

Current RMP direction lists the area as a VRM IV for visual objectives.

Hemingway Butte OHV KOP platform is located in an enclosed landscape that includes rolling hills, cliffs, and a flat top mesa. In the foreground (FG), the project components would not be seen. In the middleground (MG), the project components would be predominately backdropped against rolling hills and cliffs and intermittent.

In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 10°. The primary focus of the viewer's attention within the MG is rolling terrain and rural developments from which the project components would be in view. The viewer position would be predominately neutral.

There are 13.3 miles of the project components within the MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately .4 miles of the project components would be seen in the MG of the stationary platform, which would represent 2.6 percent of the total miles of the project components within the MG of the platform.

In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project.

**Additional Mitigating Measures (See item 3)**

Comments from item 2.

**Assumptions on Distance Zones:** Jump Creek Canyon ACEC KOP platform is approximately 0.4 miles (access roads) and 1.0 miles (transmission line) from the nearest visible project components. At a straight line distance of approximately 1 mile, transmission lines and towers would likely be visible, but would be absorbed by the existing vertical elements in the landscape, in addition to the dark background terrain.

Current RMP direction lists the KOP as a VRM II for visual objectives. However, the proposed project would follow an existing transmission line through areas of VRM class III and IV.

Jump Creek Canyon ACEC KOP platform is located in a enclosed landscape that includes rolling hills, rock outcrops, canyons, cliffs, and a defined valley. In the foreground (FG), the project components would be predominately backdropped against the valley floor and intermittent. In the middleground (MG), the project components would be predominately backdropped against valley floor, and unobstructed and intermittent.

In the FG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 20°. The primary focus of the viewer's attention is the Jump Creek recreation site and mountainous terrain from which the project components would be in view. The viewer position would be predominately superior. In the MG, the amount of viewer exposure of the project components from the stationary KOP platform would be approximately 35°. The primary focus of the viewer's attention within the MG is Jump Creek canyon and the valley floor from which the project components would be in view. The viewer position would be predominately superior.

There are .4 miles of the project components within the FG/MG of the stationary KOP platform within the VAU. Based on bare earth GIS analysis, approximately .1 miles of the project components would be seen in the FG and .1 miles would be seen in the MG of the stationary platform, which would represent 22.2 percent of the total miles of the project components within the FG and 22.2 percent within the MG of the platform.

The project components would not attract attention to the visual setting within the FG of the stationary KOP platform and the landscape would appear to be intact. The areas seen within the FG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape. In the MG area, the stationary KOP platform would not attract attention to the visual setting. In addition, the visual setting within the MG of the stationary KOP platform and the landscape would appear to be intact. The areas visible within the MG of the stationary KOP platform would not change because the proposed project would repeat the form, line, color, and texture or scale common in the landscape.

Visual resource management objectives would be met with the proposed project. The project components would be similar in appearance to existing 500kv transmission lines within 0.3 miles of the proposed project.

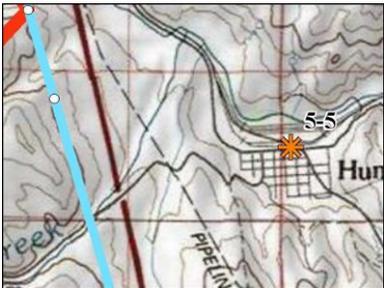

**Additional Mitigating Measures (See item 3)**

No mitigations are required for this segment from this KOP

**Applicant’s Proposed Action Alternative**

Moderate overall contrast would result from the construction and maintenance of the B2H Project in an enclosed landscape setting with lands associated with designated VRM Class IV (north side of I-84) viewed from the community of Huntington. The Project would cross VRM Class IV lands at approximately 5.0 miles away from the community of Huntington. The B2H Project would cross rolling terrain and would be partially screened due to topographic screening due to the topography on the west side of the community of Huntington. Disturbance associated with construction access would be intermittently visible from the KOP with moderate contrast for form and line and weak contrast for color and texture. The proposed structures would be seen at approximately 1.0 mile and would introduce moderate contrast for structure elements of form and line with weak contrast introduced for color and texture into the landscape. Overall contrast is reduced due to views of the B2H Project being seen in the context of the existing 138-kV and 69-kV transmission lines. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), and #14 (Overland access) would reduce contrast.

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### **Tub Mountain South Alternative**

Moderate contrast would result from construction and maintenance of the B2H Project within an enclosed community landscape setting with designated VRM Class IV land to the west as viewed from the community of Huntington. The B2H Project would cross foothills and would be mostly backdropped. Existing access roads and disturbance is screened by topography, therefore construction access disturbance to landform and vegetation would also be mostly screened from this KOP. The proposed structures would be seen at approximately 1.0 miles. The proposed structures would introduce Moderate contrast to form, line, color, and texture. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), #5 (Minimize Vegetation clearing), and #14 (Overland access) would reduce contrast.

### **Willow Creek Alternative**

Weak contrast would result from construction and maintenance of the B2H Project within a naturalistic panoramic feature landscape setting with designated VRM Class IV land (on the west of I-84) viewed from the community of Durkee. The B2H Project would cross foothills in rolling terrain and would be backdropped by adjacent terrain. Existing access roads and disturbance is screened by topography, therefore construction access disturbance to landform and vegetation would be intermittently visible from this KOP. The proposed structures would be seen at approximately 2.0 miles. The proposed structures would introduce strong contrast to form and line with moderate contrast for color and texture. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), and #14 (Overland access) would reduce contrast.

**Applicant's Proposed Action Alternative, Variation S3-B1**

Strong overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC (VRM Class III) and views towards land with VRM Class III and VRM Class IV designations. The B2H Project would cross rolling terrain and would be backdropped by adjacent terrain for recreation viewers with slightly superior viewing conditions. Views of the B2H Project to the south would see skylined conditions as it crosses the foothills. Disturbance to landform and vegetation associated with construction access would be visible from the KOP, however due to the flatness of land lands and low-growing vegetation would only be moderately visible. The proposed structures would be seen at approximately 1.1 miles and introduce Strong contrast into the landscape due to structure elements of form and line with Moderate contrast introduced for color and texture.

**Variation S3-B2**

Weak overall contrast would result from the construction and maintenance of the Project in a semi-naturalistic setting associated with The Oregon Trail ACEC with views towards the Baker Valley. Although the Project is in relatively close proximity to the KOP location (<1.0 mile) landscape and vegetation disturbance would not be seen due to topography. The proposed structures would be seen in a backdropped condition, however, contrast for structure form and texture would be Moderate with Weak contrast for line and color due to the views of the development beyond the structure locations and being seen in context of existing structures.

Moderate contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards land with VRM Class III designations. The B2H Project would cross rolling terrain and would be skylined as it crosses the ridge to the south. Disturbance to landform and vegetation associated with construction access would be weak for form, line, color and texture. The proposed structures would be seen at approximately 2.0 miles and introduce Moderate contrast into the landscape to structure elements of form and color with Weak contrast introduced for line and texture.

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### Flagstaff A Alternative

Moderate contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat terrain in the agricultural lands and would be backdropped by adjacent terrain for recreation viewers with superior viewing conditions. Disturbance to landform and vegetation associated with construction access would be fully visible from the KOP, however due to the location of the B2H Project in agricultural lands, revegetation would occur after construction and likely not be discernable after one season. The proposed structures would be seen at approximately 0.5 miles and introduce Strong contrast into the landscape to structure elements of form and line with Moderate contrast introduced for color and texture. The B2H Project would be seen in the context of an existing 230-kV line with H-frame structures, further reducing contrast.

### Flagstaff B Alternative

Strong contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat to rolling terrain and would be in the viewers' immediate foreground (< 0.25 miles). Disturbance associate with form, line, color, and texture contrast in regard to landform and vegetation associated with construction access would be strong from this KOP due to close proximity to the line and the superior viewing angle. The proposed structures would introduce Strong contrast into the landscape to structure elements of form, line, color and texture.

### Variation S3-A2

Weak contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat to rolling terrain and would be in the viewers' middleground to background (3+ miles). Disturbance associate with form, line, color, and texture contrast in regard to landform and vegetation associated with construction access would be weak from this KOP due to distance and would likely be indistinguishable. The proposed structures would introduce Weak contrast into the landscape to structure elements of form, line, color and texture. Viewing the B2H Project in the context of existing transmission lines further reduces contrast.

**Applicant’s Proposed Action Alternative, Variation S3-B1**

Moderate overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC (VRM Class IV) and views towards land with VRM Classes III and IV designations. The B2H Project would cross rolling terrain and would be mostly backdropped by adjacent terrain for recreation viewers with slightly superior viewing conditions. Views of the B2H Project to the northeast would see skylined conditions as it crosses rolling terrain. Disturbance to landform and vegetation associated with construction access would be visible from the KOP, however due to the rolling terrain and low-growing vegetation would only be intermittently visible. The proposed structures would be seen at approximately 1.5 miles and would introduce Moderate contrast to the structure elements of form and line with Moderate contrast introduced for color and texture.

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### Variation S3-B2

Moderate overall contrast would result from the construction and maintenance of the Project in a semi-naturalistic setting associated with The Oregon Trail ACEC with views towards the Baker Valley. Landscape and vegetation disturbance would be seen in conditions where the access roads are created on the rolling terrain with moderate contrast for the landform elements of form, line, and color with weak contrast for texture and Moderate contrast for vegetation for the elements of form and line and weak contrast for color and texture. The proposed structures would be seen in a backdropped condition, however, contrast for structure form and texture would be Moderate with Weak contrast for line and color due to the views of the development beyond the structure locations.

### Variation S3-B3

Weak overall contrast would result from the construction and maintenance of the Project in a semi-naturalistic setting associated with The Oregon Trail ACEC with views towards the Baker Valley. Although the Project is in relatively close proximity to the KOP location (approximately 1.0 mile) landscape and vegetation disturbance would not be seen due to topography. The proposed structures would be seen in a backdropped condition, however, contrast for structure form and texture would be Moderate with Weak contrast for line and color due to the views of the development beyond the structure locations and being seen in context of existing structures.

<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

however, contrast for structure form and texture would be Moderate with Weak contrast for line and color due to the views of the development beyond the existing structure locations.

### **Variation S3-B5**

Moderate overall contrast would result from the construction and maintenance of the Project in a semi-naturalistic setting associated with The Oregon Trail ACEC with views towards the Baker Valley. Disturbance to landform and vegetation associated with construction access would be visible from the KOP as a thin line, however contrast may be reduced seasonally as the alignment is located in agricultural lands as seen from this KOP, The proposed structures would be seen in a backdropped condition, however, contrast for structure would be Moderate for form, line, color, and texture due to the views of the development beyond the structure locations and being seen in context of existing structures.

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

Weak contrast would result from the construction and maintenance of the B2H Project in a partially enclosed landscape setting associated with The Oregon Trail ACEC (VRM Class IV) and views towards land with VRM Class IV designations. The B2H Project would cross rolling terrain and be in proximity to a 69 KV transmission line and would not be visible when crossing VRM Class IV lands due to topographic screening. Disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 1.3 miles to the east crossing I-84 and introduce moderate contrast into the landscape to structure elements of form and line with Weak contrast introduced for color and texture to VRM Class IV Landscapes. The viewing distance with the Project occurring in a backdrop condition would result in a Weak degree of contrast.

### **Proposed Activity Description (Variation S3-C1)**

Although this variation shares the alignment with the Applicant's Proposed Alternative Action, this variation is mostly screened by the topography offered by the rolling hills directly between this KOP and this variation and would have weak contrast from the construction and maintenance of the B2H Project

### **Proposed Activity Description (Variation S3-C2)**

Similar to Variation S3-C1 however this route variation would be slightly closer to the KOP resulting in the towers being more visible than the Applicant's Proposed Action Alternative. Due to topographic screening and the viewing distance the Project would result in a Weak degree of contrast.

**Applicant's Proposed Action Alternative – Variation S3-B1**

Weak overall contrast would result from the construction and maintenance of the B2H Project in an enclosed landscape setting associated with The Oregon Trail ACEC and views towards land with VRM Class III and IV designations. The B2H Project would cross rolling terrain and would be backdropped by adjacent terrain for recreation viewers with slightly superior viewing conditions. Disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 1.5 miles and introduce Weak contrast into the landscape to structure elements of form, line, color and texture.

**Flagstaff A-Burnt River Mountain Alternative**

Moderate overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC with views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat terrain and would be backdropped by adjacent terrain for recreation viewers with slightly superior viewing conditions. Disturbance to landform and vegetation associated with construction access would be visible from the KOP as a thin line, however contrast may be reduced seasonally as the alignment is located in agricultural lands as seen from this KOP. The proposed structures would be seen at approximately 0.6 miles and introduce Moderate contrast into the landscape to structure elements of form, line, color and texture. The proposed route is seen in the context of the existing 230-kV transmission structures reducing contrast further.

**Flagstaff B Alternative**

Strong contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat terrain and would be backdropped by adjacent terrain for recreation viewers with slightly superior viewing conditions. Disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 0.5 miles and introduce Moderate contrast into the landscape to structure elements of form, line, color and texture. The viewing distance with the Project occurring in a backdrop condition and seen in the context of an existing transmission line further reduces contrast. The proposed route is seen in the context of the existing 230-kV transmission structures reducing contrast further.

<b>Activity (program):</b> Transmission Line

### **Variation S3-A2**

Weak contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands within the lands associated with Baker Valley. The B2H Project would cross flat terrain and would be backdropped by adjacent terrain for recreation viewers with level viewing conditions. Disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 8.0 miles and be largely indistinct from this KOP however portions that would be visible would introduce Weak contrast into the landscape to structure elements of form, line, color and texture.

**Applicant’s Proposed Action Alternative**

Moderate overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards land with VRM Class III and IV designations. The B2H Project would cross rolling terrain and would have skylined, level views for observers from the interpretive site. Disturbance to landform and vegetation associated with construction access would be minimally visible from the KOP due to screening by topography and low-growing vegetation. The proposed structures would be seen at approximately 1.1 miles and introduce Strong contrast into the landscape to structure elements of form and line with Moderate contrast introduced for color and texture.

**Variation S3-B2**

Moderate overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC and views towards agricultural lands associated with Baker Valley. The B2H Project crosses rolling terrain, however, disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 1.0 mile and introduces Strong contrast into the landscape to structure elements of form and Moderate for line, color and texture.

## VISUAL CONTRAST RATING WORKSHEET

<b>Activity (program):</b> Transmission Line

### **Variation S3-B2**

Weak contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC with the B2H Project being located off of BLM lands. The B2H Project crosses rolling terrain, however, disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 1.0 mile and introduces Moderate contrast into the landscape to structure elements of form, line, color and texture. The viewing distance with the Project occurring in a backdrop condition would result in a strong degree of contrast

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### **Applicant's Proposed Action Alternative, Variation S3-B1**

Strong overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The NHOTIC entrance off of Highway 86 and with views towards lands with VRM Class III and IV designations. The B2H Project would cross rolling terrain and viewers of the B2H Project looking to the south would see skylined conditions as it crosses the foothills. Disturbance to landform and vegetation associated with construction access would be visible from the KOP, primarily as disturbance associated with access road or structure pad placement on steeper slopes of the ridge to the south introducing strong contrast for landform and moderate contrast for line, color, and texture. Due to the flatness and the quickly regenerative grasses as well as other similar existing vegetative patterns, vegetation contrast would likely be moderate for form and weak for line, color, and texture. The proposed structures would be seen at approximately 0.5 miles and introduce Strong contrast into the landscape to structure elements of form and line with Moderate contrast introduced for color and texture. The application of selective mitigation measures 4 (minimize slope cut and fill for access and work areas), 6 (limit new or improved accessibility to areas previously inaccessible), and 14 (overland access) would reduce project contrast in this area but still not meet VRM Class III objectives.

### Flagstaff B-Durkee Alternative

Strong contrast would result from the construction and maintenance of the B2H Project in an enclosed valley landscape setting associated with the Burnt River Canyon (VRM Class II) and views towards mountainous terrain within the lands associated with Baker Valley. The Project would cross tall rolling mountains and would be skylined over a valley with inferior viewing conditions. Disturbance to landform and vegetation associated with construction access would not be visible from the KOP due to screening by topography and vegetation. The proposed structures would be seen at approximately 0.7 miles and introduce Strong contrast into the landscape to structure elements of form and line with Moderate contrast introduced for color and texture. The viewing distance with the Project occurring in a backdrop condition would result in a strong degree of contrast. The application of selective mitigation measures 4 (minimize slope cut and fill for access and work areas), 5 (minimize tree clearing for operational clearances), 6 (limit new or improved accessibility to areas previously inaccessible), and 14 (overland access) would reduce project contrast in this area but still not meet VRM Class II objectives.

Moderate overall contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting with designated VRM Class III and VRM Class IV lands (north side of Hwy 84) viewed from the community of

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

Durkee. The B2H Project would cross rolling terrain and would be partially skylined for residential viewers with a level view. Disturbance associated with construction access would be intermittently visible from the KOP with moderate contrast for form and line and weak contrast for color and texture. The proposed structures would be seen at approximately 1.5 miles and would introduce moderate contrast for structure elements of form and line with weak contrast introduced for color and texture into the landscape. Overall contrast is reduced due to views of the B2H Project being seen in the context of the existing 138-kV and 69-kV transmission lines. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), and #14 (Overland access) would reduce contrast.

### Flagstaff A-Burnt River Mountain Alternative

Strong contrast would result from construction and maintenance of the B2H Project within a naturalistic panoramic feature landscape setting with designated VRM Class III and VRM Class IV lands (on the south of Hwy 84) viewed from the community of Durkee. The B2H Project would cross foothills in rolling terrain and would be backdropped by adjacent terrain. Existing access roads and disturbance is screened by topography, therefore construction access disturbance to landform and vegetation would be intermittently visible from this KOP. The proposed structures would be seen at approximately 2 miles. The proposed structures would introduce strong contrast to form and line with moderate contrast for color and texture. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), and #14 (Overland access) would reduce contrast.

### Flagstaff B-Burnt River West Alternative

Moderate contrast would result from construction and maintenance of the B2H Project within a naturalistic panoramic feature landscape setting with designated VRM Class II and VRM Class IV lands (on the south of Hwy 84) as viewed from the community of Durkee. The B2H Project would cross foothills and would be skylined intermittently. Existing access roads and disturbance is screened by topography, therefore construction access disturbance to landform and vegetation would be intermittently visible from this KOP. The proposed structures would be seen at approximately 2.0 miles. The proposed structures would introduce strong contrast to form and line with moderate contrast for color and texture. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), #5 (Minimize Vegetation clearing), #8 (Span and/or avoid sensitive features), and #14 (Overland access) would reduce contrast.

### Flagstaff B-Durkee Alternative

Weak contrast would result from construction and maintenance of the B2H Project within a naturalistic feature landscape setting with designated VRM Class II and VRM Class IV lands (on the south of Hwy 84) as viewed from the community of Durkee. The B2H Project would cross mountainous terrain and would be partially skylined. The proposed structures would be seen at approximately 4.0 miles. The proposed structures would introduce weak contrast to form, line, color, and texture. Similarly, landscape contrast would introduce weak contrast to form, line, color, and texture. The viewing distance with the Project occurring in a partially backdrop condition would result in a weak degree of contrast. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), #5 (Minimize Vegetation clearing), #8 (Span and/or avoid sensitive features), and #11 (Helicopter assisted construction) would further reduce contrast.

### Variation S3-C2

Moderate contrast would result from construction and maintenance of the B2H Project in a panoramic landscape setting with designated VRM Class III and VRM Class IV lands (north east side of Hwy 84) viewed from the community of Durkee. The B2H Project would cross rolling terrain and would be partially skylined for residential viewers with a level view. Disturbance associated with construction access would be visible from the KOP with moderate contrast for form and line and weak contrast for color and texture. The proposed structures would be seen at approximately 1.0 mile and would introduce moderate contrast for structure elements of form and line with weak contrast introduced for color and texture into the landscape. Overall contrast is reduced due to views of the B2H Project being seen in the context of the existing 138-kV and

#### Tub Mountain South Alternative

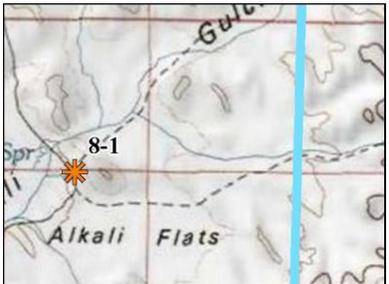

Moderate contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Weiser Dunes Campsite and views towards BLM lands with VRM Class III and IV designations. The B2H Project (Tub Mountain) would cross rolling terrain with level views partially obstructed by vegetation from the riverside. The structures would be skyline to the south where the alignment crosses rolling terrain. Disturbance to landform and vegetation associated with construction access would intermittently visible where the alignment crosses hilltops but would otherwise be screening by topography and vegetation. The proposed structures would be seen at approximately 1.2 miles and introduce Moderate contrast into the landscape to structure elements of form and line with Weak contrast introduced for color and texture.

#### Willow Creek Alternative

The Willow Creek Alternative will be primarily screened by topography for landform and vegetation disturbance but would have structures seen at a distance of approximately 3.9 miles crossing Class IV lands. The viewing distance with consideration of the Project, backdropped by a darker colored landscape setting, would result in an overall weak degree of contrast from this KOP.

<b>Key Observation Point:</b> 8-3 Oregon Trail ACEC Birch Creek		
<b>VRM Class:</b> III and IV		

### Characteristic Landscape Description

	Landform/Water	Vegetation	Structures
<b>Form</b>	FG/MG: Gently rolling, pyramidal, horizontal	FG/MG: Sparse, low, amorphous patches	N/A
<b>Line</b>	FG/MG: Horizontal and curving bands (road and trails)	FG/MG: Complex, irregular	N/A
<b>Color</b>	FG/MG: Tans, browns, and dark browns	FG/MG: Variations of green, tans, browns	N/A
<b>Texture</b>	FG/MG: Fine to medium grain	FG/MG: Smooth to medium, stippled, clustered, fine	N/A

### Proposed Activity Description (Tub Mountain South Alternative)

	Landform/Water	Vegetation	Structures
<b>Form</b>	FG: Flat, slightly rolling	FG: Low, amorphous patches	FG: Tall, vertical, geometric, triangular, transparent
<b>Line</b>	FG: Weak, broken, horizontal	FG: Weak, diffuse edge	FG: Complex, angular; concave, horizontal
<b>Color</b>	FG: Tans, browns	FG: Greens, tans, browns	FG: Dull gray
<b>Texture</b>	FG: Fine grain	FG: Fine, sparse	FG: Fine grain, matted, uniform, ordered

### Degree of Contrast (Tub Mountain South Alternative)

		Features											
		Landform/ Water Body				Vegetation				Structures			
		Strong	Moderate	Weak	None	Strong	Moderate	Weak	None	Strong	Moderate	Weak	None
<b>Elements</b>	<b>Form</b>		X			X				X			
	<b>Line</b>		X			X				X			
	<b>Color</b>			X		X				X			
	<b>Texture</b>			X		X				X			

**Does project design meet visual resource management objectives?**  
No

**Additional mitigating measures recommended?**  
Yes

**Evaluator Name(s):**  
EPG Visual Personnel

## VISUAL CONTRAST RATING WORKSHEET

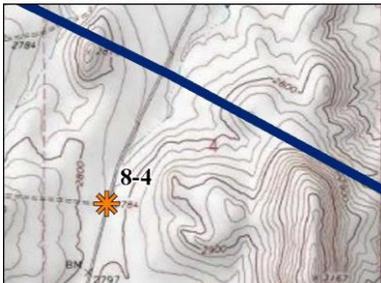

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### **Tub Mountain South Alternative**

Strong contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The Oregon Trail ACEC Birch Creek landscape. The B2H Project (Tub Mountain) would cross rolling terrain with level views of the structures at a distance of 0.25 miles with the structures proximately skylined. Disturbance to landform and vegetation associated with construction access would be fully visible to the east where the alignment crosses hilltops, however would be seen in the context of existing gas pipeline ROW disturbance this lowering contrast. The proposed structures would introduce Strong contrast into the landscape to structure elements of form, line, color and texture. The application of selective mitigation measures 4 (minimize slope cut and fill for access and work areas) and 14 (overland access) would reduce project contrast in this area but still not meet VRM Class III objectives due to skylined structures within view.

## VISUAL CONTRAST RATING WORKSHEET

<b>Date:</b> 5/2/2016
<b>District/Field Office:</b> Baker
<b>Resource Area:</b>
<b>Activity (program):</b> Transmission Line

### **Applicants Proposed Action Alternative**

Weak contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with Buck Gulch landscape. The B2H Project (Preferred route) would cross flat to rolling terrain with level views of the structures at a distance of approximately 1.75 mile. Disturbance to landform and vegetation associated with construction access would not be visible from this KOP, however the structures would be partially skylined. The proposed structures would introduce Weak contrast into the landscape due to structure elements of form, line, color and texture.

### **Malheur S Alternative**

Moderate contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with Buck Gulch landscape. The B2H Project (Malheur S Alternative) would cross rolling terrain with level views of the structures at a distance of 1.0 mile with the structures skylined. Disturbance to landform and vegetation associated with construction access would be visible to the northwest where the alignment crosses rolling terrain, however would not likely be seen in the flat areas of landscape. The proposed structures would introduce Moderate contrast into the landscape due to structure elements of form and line with weak contrast for color and texture.

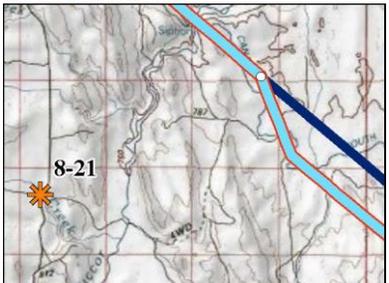

### **Malheur A Alternative**

Strong contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with Buck Gulch landscape. The B2H Project (Malheur A Alternative) would cross rolling terrain with level views of the structures at a distance of 0.4 miles with the structures skylined at the closest point. Disturbance to landform and vegetation associated with construction access would be visible towards the west where the alignment crosses rolling terrain, introducing Moderate contrast into the landscape. The proposed structures would introduce Strong contrast into the landscape due to structure elements of form, line and texture with moderate contrast for color.

### Malheur A Alternative

Weak contrast would result from the construction and maintenance of the B2H Project in a panoramic landscape setting associated with The McIntyre Ridge Proposed Wilderness Study Area located on VRM Class II lands with views of the B2H Project crossing Class IV lands at a distance of approximately 3.0 miles from the KOP. The B2H Project crosses rolling terrain and would be almost fully screened from this the KOP with no views of landform or vegetation modifications. The proposed structures would introduce Weak contrast into the landscape due to structure elements of form, line, color and texture.

<b>Activity (program):</b> Transmission Line

### **Applicant's Proposed Alternative Action**

Strong contrast would result from the construction and maintenance of the B2H Project in this landscape of rolling hills and valleys with views associated with the Owyhee Wild and Scenic River located on VRM Class II and VRM Class III. The B2H Project crossing VRM Class II would be viewed from approximately 0.1 mile away. The B2H Project crosses rolling terrain and would be highly visible due to the superior location and proximity from this KOP. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), #5 (Minimize Vegetation clearing), #8 (Span and/or avoid sensitive features), and #14 (Overland access) would reduce contrast in this area but still not meet VRM Class II objectives.

### **Variation S5-B1**

Similar to Applicant's Proposed Alternative

### **Variation S5-B2**

Strong overall contrast would result in construction and maintenance of the B2H Project in this landscape of rolling hills and valleys with views associated with the Owyhee Wild and Scenic River located on VRM Class III. The B2H Project crossing VRM Class III would be viewed from approximately 0.7 mile away. The proposed structures would introduce strong contrast to form, line, color, and texture. Selective mitigation measures #4 (minimize slope cut and fill for access and work areas), #5 (Minimize Vegetation clearing), #8 (Span and/or avoid sensitive features), and #14 (Overland access) would reduce contrast in this area but still not meet VRM Class II objectives
